2.1 Read the scenarios below and answer the questions that follow.

Peat lands are special wetlands that play a very important role in ecology. A peat land, of approximately 5 000 years old, near Mollung is almost destroyed because of excessive extraction of water from the nearby Molojo river. The water is extracted for human consumption.

Peat lands like the one near Malmberg is conserved and play an important role in storing water as well as preventing climate changes.

Dr. Peter Lougheed said that carbon that is "held" or "stored" by peat lands combats climate change because it decreases the amount of carbon in the atmosphere.

Peat lands trap about one third of the world's carbon. Approximately 50% of wetlands worldwide are peat lands. However in South Africa about 10% of the wetlands are peat lands.

Grönvall explained that peat levels can hold about 1 000 times its own mass in water. This explains the water table and is the source that keeps streams flowing. The "sponge effect" of the peat also makes it possible to store water that is then released during the seasons.

Dr. Grunling said that it might be too late to restore the peat land near Malling, but it might be possible to restore some parts of it if more water is supplied to the peat land.

The result of this destruction is depletion of the water table. The habitat of numerous fish and bird species that lived in this area had also been destroyed.
