of your solar tracking innovation. Lately, solar polygeneration, solar trigeneration, solar triple generation, and solar quad generation, adding delivery of steam, liquid, gaseous fuel, or capture food grade CO₂ systems, have a need for automatic solar tracking. These systems are known for significant efficiency increases in energy yield as a result of the integration and re-use of waste or residual heat and are suitable for compact packaged micro solar powerplants that could be manufactured and transported in kit form and operate on a plug and play basis. Typical hybrid solar power systems include compact or packaged solar micro combined heat and power (CHP or mCHP) or solar micro combined cooling heating and power (CCHP, CHPC, mCCHP or mCHPC) systems used in distributed power generation. These systems are often combined in concentrated solar (CSP and CPV), smart microgrid configurations for off-grid rural island or isolated microgrid, minigrid, and distributed power renewable energy systems. Solar tracking algorithms are also used in modelling of trigeneration systems using Matlab, Simulink, Modelica, or TRNSYS platform, as well as in automation and control of renewable energy systems through intelligent parsing, multi-objective adaptive learning control, and control optimization strategies. Solar tracking algorithms also find application in developing solar models for country or location specific solar studies, for example, in terms of measuring or analysis of the fluctuations of the solar radiation, i.e. direct and diffuse radiation in a particular area. Solar DNI, solar irradiance, and atmospheric information and models can thus be integrated into a solar map, solar atlas, or geographical information systems (GIS). Such models allow for defining local parameters for specific regions that may be valuable in terms of the evaluation of different solar in photovoltaic or CSP systems on simulation and synthesis platforms such as Matlab and Simulink, or in linear or multi-objective optimization algorithm platforms such as COMPOSE, EnergyPLAN, or DER-CAM. A dual axis solar tracker and single axis solar tracker may use a sun tracker program or sun tracker algorithm to position a solar dish, solar panel array, heliostat array, PV panel, solar antenna, or infrared solar nan antenna. A self tracking solar concentrator performs automatic solar tracking by computing the solar vector. Solar position algorithms (TwinCAT, SPA, or PSA) Algorithms use an astronomical algorithm to calculate the position of the sun. It uses astronomical software algorithms and equations for solar tracking in the calculation of sun's position in the sky for each location on the earth at any time of day. Like an optical solar telescope, the solar position algorithm pin points the solar reflector at the sun and locks onto the sun's position to track the sun across the sky as the sun progresses throughout the day. Optical sensors such as photodiodes, light dependant resistors (LDR) or photoresistors are used as optical accuracy feedback devices. Lately we also included a section in the book with links to microprocessor code on how the PixArt Wii infrared camera in the Wii remote or Wiimote may be used in infrared solar tracking applications. In order to harvest free energy from the sun, some automatic solar positioning systems use an optical means to direct the solar tracking device. These solar tracking strategies use optical tracking techniques such as a sun sensor means to direct sun rays onto a silicon or CMOS substrate to determine the X and Y coordinates of the sun's position. In a solar mems sun sensor device, incident sunlight enters the sun sensor through a small pin hole in a mask plate.
