Foundations of Phylogenetic Systematics Johann Wolfgang Wägele, 2005. Phylogeny inference and the classification of organisms are indispensable for all fields of biology. On the basis of a well-corroborated tree of life, it is possible to understand the evolution of structure and function of genomes, of gene families, of cascades of developmental genes, and the origin of genes of medical importance. Ecologists need a stable classification of organisms to identify organisms, to find their correct names, and thus further information on relevant species. This book offers an introduction to the theory of Phylogenetic Systematics and is a companion for all biologists who want to analyze morphological or molecular data with classical methods or with modern computer programs. The first part of the book explains the epistemological basis that is independent of the type of method used to construct phylogenetic trees. Unlike other empirical sciences, the estimation of data quality in phylogenetics is still little developed and very often neglected. Here, a theoretical basis is presented that enables the systematist to assess critically and objectively the quality of different data sets and to make statements on the plausibility of results. This requires a conception of the notions of information content, probability of homology, probability of cognition, probability of events, the principle of parsimony, the differentiation of phenomenological and modelling methods. Willi Hennig's original method is compared with modern numerical systematics, and an updated Hennigian procedure of data analysis is discussed. The difference between phenetic and phylogenetic cladistics is explained. Popular tools for data evaluation implemented in computer programs are explained, including their axiomatic assumptions, sources of error, and possible applications. For the more common tools, the mathematical background is explained in a simple, easy-to-understand way.

Johann Wolfgang Wägele was until recently head of the Department for Animal Systematics, Lehrstuhl für Spezielle Zoologie at the University of Bochum, and is now director of the Museum Alexander Koenig in Bonn, Germany. His main research interests are the taxonomy, phylogeny, and biodiversity of Isopoda, which implies observations of life history, biogeography, and ecology in combination with phylogeny inference. Further subjects include arthropod phylogeny and tools for explorative data analyses. The author is president of the Gesellschaft für Biologische Systematik, a Central European society of systematists, and he is actively promoting biodiversity research.

Evolutionary and Molecular Biology Robert J. Russell, William R. Stoeger, Francisco José Ayala, 1998 This collection of twenty two research papers explores the creative interaction between evolutionary and molecular biology philosophy and theology It is the result of the third of five international research conferences co sponsored by the Vatican Observatory Rome and the Center for Theology and the Natural Sciences Berkeley The over arching goal of these conferences is to support the engagement of constructive theology with the natural sciences and to investigate the philosophical and theological elements in ongoing theoretical research in the natural sciences This series of conferences builds on the initial 1987 Vatican Observatory conference and its resulting publication Physics Philosophy and Theology A Common Quest for Understanding 1988 and on the previous Jointly sponsored conferences and their publications Quantum Cosmology and the Laws of Nature

1993 and Chaos and Complexity 1995 Future conferences will focus on scientific topics including the neuroscience s quantum physics and quantum field theory Meaningful Information Anthony Reading,2011-06-16 The book introduces a radically new way of thinking about information and the important role it plays in living systems It opens up new avenues for exploring how cells and organisms change and adapt since the ability to detect and respond to meaningful information is the key that enables them to receive their genetic heritage regulate their internal milieu and respond to changes in their environment It also provides a way of resolving Descartes dilemma by explaining the workings of the brain in non mechanical terms that are not tainted by spiritual or metaphysical beliefs The types of meaningful information that different species and different cell types are able to detect are finely matched to the ecosystem in which they live for natural selection has shaped what they need to know to function effectively in those circumstances Biological detection and response systems range from the chemical configurations that govern genes and cell life to the relatively simple tropisms that guide single cell organisms the rudimentary nervous systems of invertebrates and the complex neuronal structures of mammals and primates The scope of meaningful information that can be detected and responded to reaches its peak in our own species as exemplified by our special abilities in language cognition emotion and consciousness all of which are explored within this new framework
