Modern Experimental Chemistry provides techniques of qualitative analysis that reinforce experiments on ionic equilibria. This book includes the determination of water in hydrated salts, identification of an organic compound after determining its molecular weight, and nonaqueous titration of a salt of a weak acid. The calculation of chemical stoichiometry, calculation of thermodynamic properties by determining the change in equilibrium with temperature, and chromium chemistry are also covered. This compilation contains enough experiments for classes which have six hours of laboratory, two 3-hour meetings per week, to last two semesters. This publication is intended for chemistry students as an introductory manual to chemistry laboratory.
