

## Mole Ratios

How can the coefficients in a chemical equation be interpreted?

NATALIA  
LACAYO  
P. 2

### Why?

A balanced chemical equation can tell us the number of reactant and product particles (ions, atoms, molecules or formula units) that are necessary to conserve mass during a chemical reaction. Typically when we balance the chemical equation we think in terms of individual particles. However, in real life the reaction represented by an equation occurs an unimaginable number of times. Short of writing very large numbers ( $10^{23}$  or larger) in front of each chemical in the equation, how can we interpret chemical equations so that they more realistically represent what is happening in real life? In this activity you will explore the different ways a chemical reaction can be interpreted.

### Model 1 – A Chemical Reaction

1. Consider the reaction in Model 1.
  - a. What are the coefficients for each of the following substances in the reaction?

**1**  $\text{N}_2$

**3**  $\text{H}_2$

**2**  $\text{NH}_3$

- a. Draw particle models below to illustrate the reaction in Model 1.

2. Consider each situation below as it relates to the reaction in Model 1.
  - a. Calculate the amount of reactants consumed and products made.
  - a. Record the ratio of  $\text{N}_2$  to  $\text{H}_2$  to  $\text{NH}_3$ . Reduce the ratio to the lowest whole numbers possible.

	$\text{N}_2$ Consumed	$\text{H}_2$ Consumed	$\text{NH}_3$ Produced	Ratio $\text{N}_2:\text{H}_2:\text{NH}_3$ (reduced)
For a single reaction, how many molecules of each substance would be consumed or produced?	<b>1</b>	<b>3</b>	<b>2</b>	<b>1:3:2</b>
If the reaction occurred one hundred times, how many molecules would be consumed or produced?	<b>100</b>	<b>300</b>	<b>200</b>	<b>1:3:2</b>
If the reaction occurred 538 times, how many molecules would be consumed or produced?	<b>538</b>	<b>1614</b>	<b>1076</b>	<b>1:3:2</b>

**Be Organoberyllium Compounds** Hubert Schmidbaur,2013-06-29 The present volume describes organoberyllium compounds containing at least one beryllium carbon bond except the beryllium carbides and cyanides It covers the literature completely to the end of 1986 and includes most of the references up to mid 1987 This Gmelin volume is different from all other volumes of the series on organometallic compounds in that it is dedicated to an area of research which has virtually come to a complete standstill Organoberyllium chemistry has never been a very popular field and only few workers have

contributed to its slow growth as is seen by the relatively small number of publications in the field This very modest development became stagnant in the early 1970 s and was followed by a rapid decline This exceptional fate of a branch of organometallic chemistry is only partly due to the very limited number of potential application of beryllium and its compounds The compounds of this element are in principle at least as interesting and intriguing to scientists as those of other metals in the Periodic Table No doubt the main reason for the apparent ban of all experimental organoberyllium chemistry is to be found in the established and alleged hazardous properties of beryllium compounds Although similar hazards have been established for other organometallics where active research is still in process e g mercury and lead these observations were absolutely lethal for organoberyllium research
