

| Variable                 | Method  | How will it effect the rate of fall?   |
|--------------------------|---|--|
| Surface area             | This variable can be changed by making circles with different radius              | The rate of decent should become faster as the surface area becomes smaller due to less air resistance   |
| Mass                     | The mass of the parachute can be increased by adding extra weight                 | The larger the mass of the parachute the faster it should fall to the ground   |
| Material                 | This can be changed by making parachutes with different materials                 | The type of material should effect the rate of decent and make it fall faster or slower  |
| Height                   | The height from which the parachute is dropped                                    | The higher the parachute is dropped from the ground the longer it should take to reach the ground. The lower it is dropped the faster it should reach the ground |
| Condition of environment | This can be changed by dropping the parachute in different conditions. i.e. windy | This should effect the descent of the parachute because there might be more or less wind or no wind at all   |
