

ELECTRIC FIELD INDUCED STRUCTURAL CHANGES IN  $\text{NbSe}_3$ ?R.M. Fleming, C.H. Chen and D.E. Moncton<sup>(a)</sup>*Bell Laboratories, Murray Hill, N.J. 07974, U.S.A.*

**Résumé** - Nous présentons une étude de la cohérence des ondes de densité de charge (ODC) ainsi que la recherche de possibles changements structuraux de ces ODC dans  $\text{NbSe}_3$  causés par l'action d'un champ électrique. Les résultats provenant de l'étude par radiations synchrotron ainsi que les images obtenues par microscopie électronique à champ profond, sont présentés. Nous trouvons par radiation synchrotron un ordre à longue distance pour les ODC. En revanche il fut impossible de détecter les changements des ODC produites par un champ électrique, quelles que soient les techniques utilisées, à savoir, radiation synchrotron et microscopie électronique à champ profond.

**Abstract** - We present a study of the charge-density wave (CDW) coherence and a search for possible electric field induced structural changes of the CDW in  $\text{NbSe}_3$ . Results from both synchrotron x-ray scattering and dark-field electron microscope images are presented. We find from synchrotron scattering that the CDW exhibits long range order. We find no apparent field-induced changes of the CDW either in the synchrotron results or the dark-field images.

The question of whether or not  $\text{NbSe}_3$  undergoes electric-field induced structural changes was originally addressed in 1978 in the same x-ray diffraction study where we reported structural evidence of two charge-density waves (CDW's) in  $\text{NbSe}_3$  /1/. At that time, we were primarily interested in the behavior of the CDW order parameter as a function of electric field. We felt it was important to show that the CDW state was not suppressed with field as would be the case if one had single particle tunneling across a CDW energy gap. Our observation of a field-independent CDW amplitude has played a key role in the development of a current-carrying or "sliding-mode" model of the CDW. Recently, however, Gill has suggested on the basis of transport data that there may be field-induced meta-stable states of the CDW /2/. Conceivably these meta-stable states might result in a structural distortion of the CDW which would be reflected in an electric-field dependent CDW amplitude or wave-vector. Moreover, questions have been raised about the extent of the CDW coherence in  $\text{NbSe}_3$ . This has been particularly important in the interpretation of the role of impurity pinning in the observed no response to a dc field. Because of the lack of sufficient resolution, these questions were not addressed in our original x-ray study. In that experiment an increase in resolution would have resulted in unacceptably low signal rates.

In the talk today I will present data taken with the Stanford Synchrotron Radiation Laboratory (SSRL) synchrotron x-ray source where resolution and intensity problems are less by orders of magnitude /3/. We have found that even with high q-resolution scattering the CDW appears to have long range order ( $> 5000 \text{ \AA}$ ). Moreover, the CDW coherence and wave-vector are unaffected by electric fields sufficient to induce a non-linear response. In addition we have made precise measurements of the CDW wave vector and have addressed the question of whether or not  $q_1 + q_2 = (.5 \ .5 \ .5)$  as suggested in our earlier x-ray experiment.
