An Introduction to Architectural Theory Harry Francis Mallgrave, David J. Goodman, 2011-03-16 A sharp and lively text that covers issues in depth but not to the point that they become inaccessible to beginning students. *An Introduction to Architectural Theory* is the first narrative history of this period charting the veritable revolution in architectural thinking that has taken place as well as the implications of this intellectual upheaval. The first comprehensive and critical history of architectural theory over the last fifty years surveys the intellectual history of architecture since 1968 including criticisms of high modernism, the rise of postmodern and poststructural theory, critical regionalism and tectonics. Offers a comprehensive overview of the significant changes that architectural thinking has undergone in the past fifteen years. Includes an analysis of where architecture stands and where it will likely move in the coming years.

Automatic Architecture Sean Keller, 2018-02-12 In the 1960s and 70s architects influenced by recent developments in computing and the rise of structuralist and poststructuralist thinking began to radically rethink how architecture could be created. Though various new approaches gained favor they had one thing in common: they advocated moving away from the traditional reliance on an individual architect's knowledge and instincts and toward the use of external tools and processes that were considered objective, logical or natural. Automatic architecture was born. The quixotic attempts to formulate such design processes extended modernist principles and tried to draw architecture closer to mathematics and the sciences. By focusing on design methods and by examining evidence at a range of scales from institutions to individual buildings, *Automatic Architecture* offers an alternative to narratives of this period that have presented postmodernism as a question of style. As the methods and techniques traced here have been more deeply consequential than the many stylistic shifts of the past half century, Sean Keller closes the book with an analysis of the contemporary condition suggesting future paths for architectural practice that work through but also beyond the merely automatic.

Radical Pedagogies Beatriz Colomina,Ignacio G. Galán,Evangelos Kotsioris,Anna-Maria Meister,2022-05-31 Experiments in architectural education in the post World War II era that challenged and transformed architectural discourse and practice In the decades

after World War II new forms of learning transformed architectural education These radical experiments sought to upend disciplinary foundations and conventional assumptions about the nature of architecture as much as they challenged modernist and colonial norms decentered building imagined new roles for the architect and envisioned participatory forms of practice Although many of the experimental programs were subsequently abandoned terminated or assimilated they nevertheless helped shape and in some sense define architectural discourse and practice This book explores and documents these radical pedagogies and efforts to defy architecture's status quo The experiments include the adaptation of Bauhaus pedagogy as a means of unlearning under the conditions of decolonization in Africa a movement to design for every body including the disabled by architecture students and faculty at the University of California Berkeley the founding of a support network for women interested in the built environment regardless of their academic backgrounds and a design studio in the USSR that offered an alternative to the widespread functionalist approach in Soviet design Viewed through their dissolution and afterlife as well as through their founding stories these projects from the last century raise provocative questions about architecture's role in the new century

The Architecture of Evolution Marco Tamborini, 2022-12-20 In the final decades of the twentieth century the advent of evolutionary developmental biology *evo devo* offered a revolutionary new perspective that transformed the classical neo-Darwinian gene-centered study of evolution In *The Architecture of Evolution* Marco Tamborini demonstrates how this radical innovation was made possible by the largely forgotten study of morphology Despite the key role morphology played in the development of evolutionary biology since the 1940s the architecture of organisms was excluded from the Modern Evolutionary Synthesis And yet from the beginning of the twentieth century to the 1970s and 80s morphologists sought to understand how organisms were built and how organismal forms could be generated and controlled The generation of organic form was they believed essential to understanding the mechanisms of evolution Tamborini explores how the development of *evo devo* and the recent organismal turn in biology involved not only the work of morphologists but those outside the biological community with whom they exchanged their data knowledge and practices Together with architects and engineers they worked to establish a mathematical and theoretical basis for the study of organic form as a mode of construction developing and reinterpreting important notions that would play a central role in the development of evolutionary developmental biology in the late 1980s This book sheds light not only on the interdisciplinary basis for many of the key concepts in current developmental biology but also on contributions to the study of organic form outside the English speaking world
