

## Chapter 33

### Protostomes

**Summary:** Almost all bilaterian animals belong to one of two clades, the protostomes and the deuterostomes. These clades differ in how they develop embryologically- in protostomes, the mouth of the near adult animal develops from the blastopore or from an opening near it, whereas in deuterostomes, the blastopore gives rise to the anus and the mouth develops in other ways. The great majority of all animal species are protostomes, including insects, mollusks, worms, and many others.

### 33.1 The Clades of Protostomes

Lophotrochozoans develop as embryos using spiral cleavage. Most live in water and move through it using cilia or contractions of the body musculature. Ectozoans are animals that can molt.

### 33.2 Flatworms (Platyhelminthes)

**Flatworms have an incomplete gut:** Free-living flatworms move by muscles and ciliated epithelial cells. They also exhibit a head and an incomplete gut.

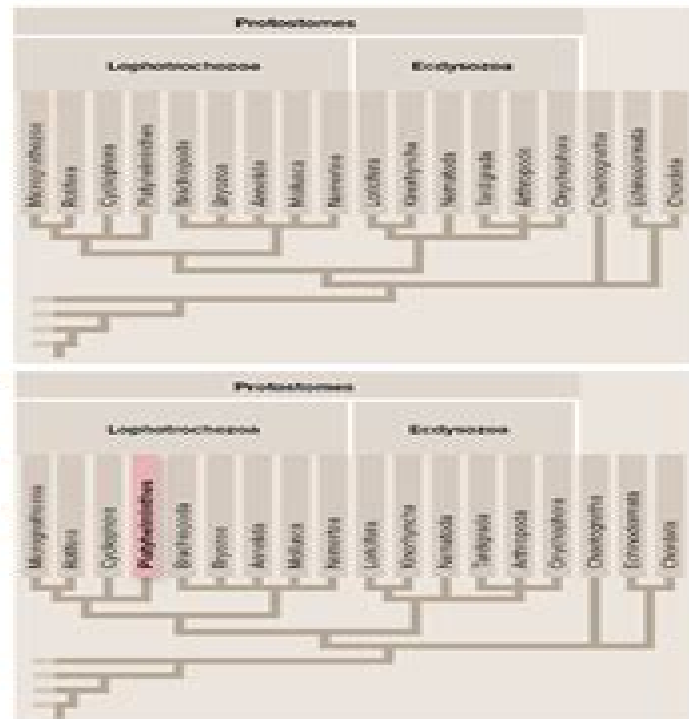

Flatworms have an excretory system containing

a fine network of tubules with flame cells. The primary function of this system is water balance.

Flatworms reproduce sexually and are hermaphroditic. They also have the capacity for asexual regeneration.

**Most parasitic flatworms evolved from free-living ancestors:** Parasitic flatworms evolved only once, their ancestors were free-living.
