SCIAMACHY - Exploring the Changing Earth's Atmosphere Manfred Gottwald,Heinrich Bovensmann,2010-12-08 SCIAMACHY the SCanning Imaging Absorption spectroMeter for Atmospheric

SCIAMACHY is a passive sensor for exploring the Earth's atmosphere. It is part of the payload of the European Earth Observation mission ENVISAT launched on 1 March 2002. SCIAMACHY observes absorption spectra of molecules from the UV 214 nm to the short wave infrared wavelength range 2386 nm and derives the atmospheric composition trace gases, aerosols, clouds from these measurements. Having meanwhile successfully monitored and explored the Earth's atmosphere for more than 8 years, new and exciting insights into the Earth atmosphere system are obtained. The provided global data sets do not only cover greenhouse gases and pollutants in the troposphere or the ozone chemistry in the stratosphere but even reach up to the mesosphere and lower thermosphere. They contribute significantly to atmospheric physics and chemistry as well as climate change research. SCIAMACHY is one of the major current Earth Observation undertakings of Germany, The Netherlands and Belgium, accomplished in cooperation with the European Space Agency (ESA). Many scientific groups at various institutes in Europe and abroad were and are actively involved in the analysis of the data. This book is a comprehensive summary describing the entire SCIAMACHY mission from the very first ideas to the current results. It illustrates how the measurements are performed, how the trace gas concentrations are derived from the measured spectra, and how the unique data sets are used to improve our understanding of the changing Earth's atmosphere. The targeted readership is not only the existing and potentially new SCIAMACHY data users from undergraduate student level up to researchers new in the fields of atmospheric chemistry and remote sensing but anyone who is keen to learn about SCIAMACHY's efforts to study the atmosphere and its responses to both natural phenomena and anthropogenic effects.

Punching of Structural Concrete Slabs fib Fédération internationale du béton, 2001-01-01. Punching is considered to be one of the most difficult problems in structural concrete design and mechanical models or theoretical analyses were developed rather late in the history of concrete research attempts. This fib Bulletin reviews the development of design models and theoretical analyses since the CEB Bulletin 168 Punching Shear in Reinforced Concrete State of the Art Report published in 1985. The role of the concrete tensile strength was specially addressed. In this respect, the present bulletin is also following up the CEB Bulletin 237 Concrete Tension and Size Effects Utilisation of concrete tension in structural concrete design and relevance of size effect. Contributions from CEB Task Group 2.7 published in 1997. Apart from new theoretical developments, a comprehensive databank for comparisons with experimental evidence is included. About 400 punching tests were critically reviewed and evaluated in a consistent manner. This is thought to be the first step towards a generally agreed selection of reliable tests. The evident value of such a data bank is illustrated by comparisons carried out between the data and some of the analytical proposals as well as empirical code formulas.
