Chemicals in the Environment and Brain Development: Importance of Neuroendocrinological Approaches Fumihiko Maekawa, Kazuaki Nakamura, Shoji F. Nakayama, 2017-05-11 Mounting evidence shows that increasing numbers of children are being diagnosed with neurodevelopmental disorders and it is clear that this increase cannot be explained by genetic background alone. A number of studies including epidemiological studies have found an association between in utero and childhood exposure to certain chemicals such as endocrine disruptors, psychoactive pharmaceuticals, volatile organic chemicals, persistent organic compounds, and heavy metals and children's brain development. Yet the mechanisms by which these chemicals impair brain development and function are not fully understood. In addition, little is known about how these chemicals enter and accumulate in the brain. Experimental approaches are essential to understand how those harmful chemicals enter children's brain and pose discrete effects on specific brain sites. These approaches include the following: improvement of technologies for the detection and measurement of neuroendocrinological and behavioral changes in animal models; development of analytical methods for the identification and quantification of chemicals and their metabolites in the brain; development of in vitro cell line assays and imaging technologies to illustrate cellular functions. In this research topic, we collected articles that provide state-of-the-art science and technologies that can help us identify environmental chemicals that influence brain development. We also included articles that lead to a better understanding of the actions and dynamics of these chemicals. The articles in this research topic supplied novel information about harmful endpoints of environmental chemicals. The reviews demonstrated the typical and novel interactions between environmental chemicals and the developing brain. We believe that these studies would lead to further understanding of neurodevelopmental disorders caused by environmental factors.

Practical Manual of In Vitro Fertilization Zsolt Peter Nagy, Alex C. Varghese, Ashok Agarwal, 2012-04-23 The Practical Manual of In Vitro Fertilization: Advanced Methods and Novel Devices is a unique accessible title that provides a complete review of the most well established and current diagnostic and treatment techniques comprising in vitro fertilization. Throughout the chapters, a uniform structure is employed, including a brief abstract, a keyword glossary, a step-by-step protocol of the laboratory procedures, several pages of expert commentary, key issues of clinical concern, and a list of references. The result is a readily accessible, high quality reference guide for reproductive endocrinologists, urologists, embryologists, biologists, and research scientists. The Manual also offers an excellent description of novel procedures that will likely be employed in the near future. An indispensable resource for physicians and basic scientists, the Practical Manual of In Vitro Fertilization: Advanced Methods and Novel Devices is an invaluable reference and addition to the literature.

Brittle Matrix Composites Johan Van Ackeren, Jan Wastiels, 2012-11-12 This paper aims to get insight into the physical significance of the results obtained from curve fitting of a stochastic cracking model on experimental tensile stress-strain data of cementitious composites which are uniaxially reinforced with continuous fibre bundles of

different kinds such as glass basalt carbon polyethylene and polyvinyl alcohol fibres An experimental test program is performed on the different composites containing typically 20% in volume of fibres as well on the fibre bundles themselves A short introduction is given to the theory behind the stochastic cracking model based on a Weibull distribution of the matrix cracking stress which is used for modelling the experimental results The obtained tensile stress strain curves are analysed by means of curve fitting and an attempt is made to draw conclusions on the physical meaning of these results The experimental results of tensile tests on specimens with an inorganic phosphate cement matrix containing the different fibre types revealed a wide range of mechanical behaviour carbon fibres result in a very stiff material PE fibres in a very strong material while the use of PVA fibres results in a very flexible and ductile composite Curve fitting of the stochastic cracking model on the experimental data was successfully performed leading to the identification of the Weibull model parameters The reference cracking strength was found to be much higher than the mean matrix cracking strength An interpretation based on the phenomenon of crack suppression is given for these high values compared to those found in literature for cement composites
