Hong,Anh Phan,2023-07-12 The objective of spatial analysis techniques is to describe the patterns existing in spatial data and
to establish preferably quantitatively the relationships between different geographic variables The notion of spatial analysis
in a Geographic Information Systems GIS environment encompasses the idea of integrating spatial data and alphanumeric
attributes and translating it into a series of functions related to selection and data search on the one hand and with modeling
on the other There have been substantial advances in spatial analysis techniques in GIS mainly in the form of more faithfully
apprehending the relationships inherent to the geographic phenomenon something that was proven impossible to do with
non spatial techniques Nowadays spatial analysis involves a set of techniques used to analyze and model variables with
distribution in space and or time The new era of spatial analysis must also consider the possibilities of integrating artificial
intelligence in simulation geosimulation processes in computerized environments geocomputation in close relationship with
models developed in real situations GIS have emerged as useful tools in geographic modeling processes helping to answer
questions about the time variability of the landscape structure study the behavior of fire predict areas of urban expansion
analyze propagation phenomena model animal movement and behavior and determine periods and areas of high risk of
flooding among other phenomena GIS and Spatial Analysis is a critical book that provides different methodologies that
combine the potential data including Big Data analysis with GIS applications It gives readers a comprehensive overview of
the current state of the art methods of spatial analysis focusing both on the new philosophical and theoretical foundations for
spatial analysis and on a flexible framework for analysis in the real world for problems such as complexity and uncertainty
