L. Mittal, 2009-04-24 Superhydrophobic surfaces water contact angles higher than 150 can only be achieved by a combination of hydrophobicity low surface energy materials with appropriate surface texture In nature one can find an array of impressive and elegant examples of superhydrophobic surfaces For example on a lotus leaf rain drops bounce off after impact then entirely roll off the lotus leaf and drag along any dirt particles without leaving residues The artificial design of superhydrophobic and self cleaning surfaces has become an extremely active area of fundamental and applied research This book presents both fundamental and applied aspects of superhydrophobic surfaces It describes also different strategies for making superhydrophobic surfaces from a large diversity of materials polymers metals and other inorganic materials composites and processes lithographic techniques electrochemical processes self assembly processes colloidal particles sol gel processes nanofilaments or simple scraping A bountiful of information is covered in this book which represents cumulative wisdom of many world renowned researchers in the fascinating and burgeoning area of superhydrophobic surfaces *The role of bile acid (ba) and related metabolites and hormone abnormalities in metabolic diseases* Yanli Pang, Changtao Jiang, Frank Gonzalez, Fang Zhongze, 2023-04-17 *Alkaline Electrochemical Power Sources* D. occurring in Nature such as cellulose or starch or biobased polymers that are artificially synthesized from natural resources Since the late 1990s the polymer industry has faced two serious problems global warming and anticipation of limitation to the access to fossil resources One solution consists in the use of sustainable resources instead of fossil based resources Hence biomass feedstocks are a promising resource and biopolymers are one of the most dynamic polymer area Additionally biodegradability is a special functionality conferred to a material bio based or not Very recently facing the awareness of the volumes of plastic wastes biodegradable polymers are gaining increasing attention from the market and industrial community This special issue of Molecules deals with the current scientific and industrial challenges of Natural and Biobased Polymers through the access of new biobased monomers improved thermo mechanical properties and by substitution of harmful substances This themed issue can be considered as collection of highlights within the field of Natural Polymers and Biobased Polymers which clearly demonstrate the increased interest in this field We hope that this will inspire researchers to further develop this area and thus contribute to futures more sustainable society

Biological Communities Respond to Multiple Human-Induced Aquatic Environment Change Marina Manca, Roberta Piscia, 2020-05-28 Perturbations linked to the direct and indirect

impacts of human activities during the Anthropocene affect the structure and functioning of aquatic ecosystems to varying degrees. Some perturbations involve stress to aquatic life including soil and water acidification, soil erosion, loss of base cations, release of trace metals, organic compounds, and application of essential nutrients capable of stimulating primary productivity. Superimposed onto these changes, climate warming impacts aquatic environments via altering species metabolic processes and by modifying food web interactions. The interaction of stressors is difficult to predict because of the differential response of species and taxonomic groups interacting additively, synergistically, or antagonistically. Whenever different trophic levels respond differently to climate warming, food webs are restructured, yet the consequences of warming-induced changes for the food web structure and long-term population dynamics of different trophic levels remain poorly understood. Such changes are crucial in lakes where food web production is mainly due to ectotherms which are highly sensitive to changes in their surrounding environment. Due to its remarkable physical inertia, including thermal stability, global warming also has a profound effect on groundwater ecosystems. Combining contemporary and palaeo data is essential to understand the degree to which mechanisms of stressors impact on lake biological communities and lake ecosystem functioning. The degree to which alterations can affect aquatic ecosystem structure and functioning also requires functional diversity to be addressed at the molecular level to reconstruct the role different species play in the transfer of material and energy through the food web. In this issue, we present examples of the impact of different stressors and their interaction on aquatic ecosystems, providing long-term metabolic, molecular, and paleolimnological analyses.
