Stump, 2019-01-10 The Oxford Handbook of Historical Ecology and Applied Archaeology presents theoretical discussions methodological outlines and case studies describing the field of overlap between historical ecology and the emerging sub discipline of applied archaeology to highlight how modern environments and landscapes have been shaped by humans Historical ecology is based on the recognition that humans are not only capable of modifying their environments but that all

environments on earth have already been directly or indirectly modified. This includes anthropogenic climate change, widespread deforestations and species extinctions but also very local alterations the effects of which may last a few years or may have legacies lasting centuries or more. With contributions from anthropologists, archaeologists, human geographers and historians, this volume focuses not just on defining human impacts in the past but on the ways that understanding these changes can help inform contemporary practices and development policies. Some chapters present examples of how ancient or current societies have modified their environments in sustainable ways while others highlight practices that had unintended long term consequences. The possibilities of learning from these practices are discussed as is the potential of using the long history of human resource exploitation as a method for building or testing models of future change. The volume offers overviews for students, researchers and professionals with an interest in conservation or development projects who want to understand what practical insights can be drawn from history and who seek to apply their work to contemporary issues.

Forest Landscapes and Global Change João C. Azevedo, Ajith H. Perera, M. Alice Pinto, 2014-07-11. Climate change, urban sprawl, abandonment of agriculture, intensification of forestry and agriculture, changes in energy generation and use, expansion of infrastructure networks, habitat destruction and degradation and other drivers of change occur at increasing rates. They affect patterns and processes in forest landscapes and modify ecosystem services derived from those ecosystems. Consequently, rapidly changing landscapes present many new challenges to scientists and managers. While it is not uncommon to encounter the terms global change and landscape together in the ecological literature, a global analysis of drivers of change in forest landscapes and their ecological consequences have not been addressed adequately. That is the goal of this volume: an exploration of the state of knowledge of global changes in forested landscapes with emphasis on causes and effects and challenges faced by researchers and land managers. Initial chapters identify and describe major agents of landscape change: climate, fire and human activities. The next series of chapters address implications of changes on ecosystem services, biodiversity, conservation and carbon flux. A chapter that describes methodologies of detecting and monitoring landscape changes is presented followed by a chapter that highlights the many challenges forest landscape managers face amidst global change. Finally, we present a summary and a synthesis of the main points presented in the book. Each chapter will contain the individual research experiences of chapter authors augmented by review and synthesis of global scientific literature on relevant topics as well as critical input from multiple peer reviewers.
