

a system continuously conditioned inside the house. By analyzing the heat and air flow, we learn what heat transfer (see Ch. 10) occurs between the house and its hot summer days. A thermodynamic analysis will tell us the conditions needed to maintain the temperature and relative humidity, and that moisture will tell us the size of the fan required to push the air in, out, and the duct needed to distribute the cooled air throughout.

Perhaps we want to focus on the air conditioner itself. Figure 1.2 is a schematic of two heat exchangers, a compressor, and a valve. A thermodynamic analysis would tell us how much energy is needed to cool the air. A heat transfer analysis would tell us the size of the heat exchangers. The fluid dynamics analysis would tell us the pressure drop across the compressor, as well as the needed compressor flow.

FIGURE 1.2 Schematic of vapor-compression refrigeration cycle.

FIGURE 1.3 Schematic of a building with multiple rooms.

It is a simple task, consider a cooling system used in a computer (Figure 1.3). The computer chips and power supply must be cooled so that the reliability of the system is not compromised. One common cooling approach is to force air through the computer case to remove unwanted heat. A thermodynamic analysis of each chip, power supply, and compressor as well as the amount of energy that must be removed from inside the computer case so that the temperature of the air entering the electronic components will not exceed a given limit. That number analysis will tell us what fan and design, too, is often cooling systems are needed to maintain the components at a safe temperature. Fluid dynamics will tell us the fan size needed to force air through the air filter and then the air out of the computer and out of the computer case.

1.2 THERMAL AND FLUID SYSTEMS ANALYSIS AND ENGINEERING

Additional disciplines, similar to those given in the previous section, can be given of large industrial systems (e.g., power plants, oil refineries, chemical processing plants) and related processes (e.g., heat treatment of metals, food processing) that would illustrate how thermodynamics, heat transfer, and fluid dynamics are all needed in many design fields. It is the integrated use of these three disciplines that is required for rational and complete analysis of many systems.

Whether the objective is given an assignment to design a new device or modification to an existing process or to predict the performance of a device, the objective of the present course must be very clear. Subsequent, which aspect of the device, process, or system in which we focus must be well defined. A systematic approach to the whole analysis is needed. Figure 1.4 shows a flow diagram of the steps required to take when analyzing and engineering a thermal fluid system. We always begin with the physical system (e.g., the engine of a car). This is reality. The engineer's job is, first, to translate the physical reality into a physical model and, second, to describe the physical model with a mathematical model. The actual physical system may be so complex that it is impossible to fully describe each part within process. However, we require that there be a model, a picture, or picture that we can use to describe and represent the system sufficiently so that it can be modeled. Once a physical model is developed, then physical laws that govern the process (e.g., a flow, momentum, mass, or energy balance) are used to create the
