

Gregor Mendel and Inheritance

Gregor Mendel was a scientist who discovered the laws of hereditary in the 19th Century. In one of his experiments he crossed pure breeding peas with red flowers with pure breeding peas with white flowers. All the offspring in the first generation had red flowers.

a) Use a genetic diagram to show how this could happen.

Phenotype	Red Flower	x	White Flower	
Genotype	RR	x	rr	(✓)
Gametes	R		r	(✓)

(✓)

All Red/100% Red (✓)

b) Explain what the terms dominant and recessive mean when discussing genetic inheritance. Use the experiment above to illustrate your answer.

A dominant allele (✓) is always expressed in the phenotype (✓)

A recessive allele can be hidden by a dominant allele (✓)

A recessive allele requires two copies to be present to be expressed in the phenotype (✓)

c) When these first generation peas were crossed some of the second generation had white flowers. Use a genetic diagram to show why this could happen.

Phenotype	Red Flower	x	Red Flower	
Genotype	Rr	x	Rr	(✓)
Gametes	R and r		R and r	(✓)

(✓)

75% Red 25% White or

25% Homozygous Red 50% Heterozygous Red 25% Homozygous White (✓)

Participatory Plant Breeding: Concept and Applications Atul Bhargava, Shilpi Srivastava, 2019-04-13

Plant breeding has played a significant role in the development of human civilizations Conventional plant breeding has significantly improved crop yield by genetically manipulating agronomically important traits However it has often been criticized for ignoring indigenous germplasm failing to address the needs of the marginal and the poor farmers and emphasizing selection for broad instead of local adaptation Participatory plant breeding PPB is the process by which the producers and other stakeholders are actively involved in a plant breeding programme with opportunities to make decisions throughout The Working Group on Participatory Plant Breeding PPBwg was established in 1996 under the framework of the Consultative Group on International Agricultural Research CGIAR Research in PPB can promote informed participation and trust in research among consumers and producers and in recent years PPB has had a significant impact on food production by quickly and cost effectively producing improved crop varieties At the same time there has been significant research in the area PPB offers significant advantages that are particularly relevant to developing countries where large investments in plant breeding have not led to increased production especially in the marginal environments In addition to the economic benefits participatory research has a number of psychological moral and ethical benefits which are the consequence of a progressive empowerment of the farming communities PPB can empower groups such as women or less well off farmers that are traditionally left out of the development process This book explores the potential of PPB in the coming decades The topic is more relevant since international breeding efforts for major crops are aimed at decentralizing local breeding methods to better incorporate the perspective of end users into the varietal development process The first book incorporating the upcoming research on this novel breeding approach it reviews the important tools and applications of PPB in an easy to read succinct format with illustrations to clarify these complex topics It provides readers with a basic idea of participatory plant breeding as well as advances in the field and insights into the future to facilitate the successful integration of farmers into breeding programmes This book is a valuable reference resource for agriculturists agricultural advisers policy makers NGOs post doctoral students and scientists in agriculture horticulture forestry and botany
