

L = Lift
D = Drag
W = Weight

a = Glide Angle

d = Horizontal Distance
 h = Vertical Height

Horizontal Force Equation: $L \sin(a) = D \cos(a)$

$$\text{ratio} = \frac{\text{Lift}}{\text{Drag}} = \frac{L}{D} = \frac{cl}{cd} = \frac{1}{\tan(a)} = \frac{d}{h} = \frac{\text{distance}}{\text{height}}$$

Lab Report For Drag And Lift Force:

TRRL *Laboratory Report* Transport and Road Research Laboratory, 1983 Report United States. National Bureau of Standards, 1968 **Scientific and Technical Aerospace Reports**, 1992 Current Hydraulic Laboratory Research in the United States, 1964 **Technical Report** Aeronautical Research Council (Great Britain), 1920 Includes its Reports which are also issued separately **U.S. Government Research Reports**, 1962 *Laboratory Report LR* National Aeronautical Establishment (Canada), 1958 *Progress in Aeronautical Sciences* D. Küchemann, P. Carrière, B. Etkin, 2016-07-02 Progress in Aeronautical Sciences Volume 8 is a collection of papers that covers the widening field of aeronautical sciences The first article deals with problems in fluid mechanics and practical aerodynamics This paper includes reducing problems to integral equations the comparison of calculated results with exact analytic solutions and with experimental pressure distributions using various configurations The book follows this discussion with a review of the methods for designing swept winged aircraft including the design of a symmetrical fuselage combination at zero incidence The text also reviews the propulsion characteristics of a hypothetical aircraft flying at hypersonic speeds and then focuses on air breathing engines to power hypersonic aircrafts of which the scramjet is the most promising The publication renders a comprehensive report on the viscous flow in boundary layers in ducts under rarefied conditions The book then reviews investigations made on the viscous flow through tubes both in continuum flow and in free molecule flow Another paper develops the fundamental mathematical and physical bases of magnetohydrodynamic flow through ducts in the presence of an applied electromagnetic field Such review is useful when applied to electromagnetic flowmeters pumps or generators The volume can be helpful for aerodynamic researchers aviation technologists and designers and aeronautical engineers *Transport Phenomena Fundamentals* Joel L. Plawsky, 2020-02-27 The fourth edition of Transport Phenomena Fundamentals continues with its streamlined approach to the subject based on a unified treatment of heat mass and momentum transport using a balance equation approach The new edition includes more worked examples within each chapter and adds confidence building problems at the end of each chapter Some numerical solutions are included in an appendix for students to check their comprehension of key concepts Additional resources online include exercises that can be practiced using a wide range of software programs available for simulating engineering problems such as COMSOL Maple Fluent Aspen Mathematica Python and MATLAB lecture notes and past exams This edition incorporates a wider range of problems to expand the utility of the text beyond chemical engineering The text is divided into two parts which can be used for teaching a two term course Part I covers the balance equation in the context of diffusive transport momentum energy mass and charge Each chapter adds a term to the balance equation highlighting that term's effects on the physical behavior of the system and the underlying mathematical description Chapters familiarize students with modeling and developing mathematical expressions based on the analysis of a control volume the derivation of the governing differential equations and the solution to those equations

with appropriate boundary conditions Part II builds on the diffusive transport balance equation by introducing convective transport terms focusing on partial rather than ordinary differential equations The text describes paring down the full microscopic equations governing the phenomena to simplify the models and develop engineering solutions and it introduces macroscopic versions of the balance equations for use where the microscopic approach is either too difficult to solve or would yield much more information that is actually required The text discusses the momentum Bernoulli energy and species continuity equations including a brief description of how these equations are applied to heat exchangers continuous contactors and chemical reactors The book introduces the three fundamental transport coefficients the friction factor the heat transfer coefficient and the mass transfer coefficient in the context of boundary layer theory Laminar flow situations are treated first followed by a discussion of turbulence The final chapter covers the basics of radiative heat transfer including concepts such as blackbodies graybodies radiation shields and enclosures

U.S. Government Research & Development Reports, 1971 **Technical Report of the Aeronautical Research Committee for the Year ...**, 1926 **Transactions** Institution of Gas Engineers, 1946 *Applied Mechanics Reviews*, 1962 **Report** National Physical Laboratory (Great Britain). Metrology Centre, 1916 **Bibliography of Scientific and Industrial Reports**, 1948 *Annual Report* National Physical Laboratory (Great Britain), 1920 *Reports and Memoranda*, 1921 **Transport Phenomena Fundamentals, Third Edition** Joel L. Plawsky, 2014-01-23

The third edition of Transport Phenomena Fundamentals continues with its streamlined approach to the subject of transport phenomena based on a unified treatment of heat mass and momentum transport using a balance equation approach The new edition makes more use of modern tools for working problems such as COMSOL Maple and MATLAB It introduces new problems at the end of each chapter and sorts them by topic for ease of use It also presents new concepts to expand the utility of the text beyond chemical engineering The text is divided into two parts which can be used for teaching a two term course Part I covers the balance equation in the context of diffusive transport momentum energy mass and charge Each chapter adds a term to the balance equation highlighting that term s effects on the physical behavior of the system and the underlying mathematical description Chapters familiarize students with modeling and developing mathematical expressions based on the analysis of a control volume the derivation of the governing differential equations and the solution to those equations with appropriate boundary conditions Part II builds on the diffusive transport balance equation by introducing convective transport terms focusing on partial rather than ordinary differential equations The text describes paring down the microscopic equations to simplify the models and solve problems and it introduces macroscopic versions of the balance equations for when the microscopic approach fails or is too cumbersome The text discusses the momentum Bournoulli energy and species continuity equations including a brief description of how these equations are applied to heat exchangers continuous contactors and chemical reactors The book also introduces the three fundamental transport coefficients the friction factor the heat transfer coefficient and the mass transfer coefficient in the

context of boundary layer theory The final chapter covers the basics of radiative heat transfer including concepts such as blackbodies graybodies radiation shields and enclosures The third edition incorporates many changes to the material and includes updated discussions and examples and more than 70 new homework problems
