*Fish Biology* Derek Burton, Margaret Burton, 2018 *Essential Fish Biology* provides an introductory overview of the functional biology of fish and how this may be affected by the widely contrasting habitat conditions within the aquatic environment. It describes the recent advances in comparative animal physiology which have greatly influenced our understanding of fish function as well as generating questions that have yet to be resolved. Fish taxa represent the largest number of vertebrates with over 25 000 extant species. However, much of our knowledge apart from taxonomy and habitat descriptions has been based on relatively few of them, usually those which live in fresh water and/or are of commercial interest. Unfortunately, there has also been a tendency to base our interpretation of fish physiology on that of mammalian systems as well as to rely on a few type species of fish. This accessible textbook will redress the balance by using examples of fish from a wide range of species and habitats, emphasizing diversity as well as recognizing shared attributes with other vertebrates.

*Natural Selection Theory in Non-majors' Biology* Dianne Leigh Anderson, 2003. Evolution by natural selection is the dominant and unifying theme in biology, yet many college students hold alternative conceptions about the topic even after completing general biology. To develop effective instructional strategies and track conceptual understanding, it is useful to have a detailed assessment tool easily used with large classes. This study presents the Conceptual Inventory of Natural Selection (CINS), a distractor-driven twenty-item multiple-choice test that assesses understanding of ten concepts related to natural selection: biotic potential, stable populations, limited natural resources, limited survival variation, variation within a population, variation inherited, differential survival, change in populations, origin of variation, and origin of species. Development, refinement, and field testing of individual CINS items are presented, and validity, readability, reliability, and factor analysis of the CINS are described. There was significant correlation between student performance on the posttest CINS and end-of-semester interviews, suggesting that the CINS is a useful classroom tool. The CINS was used as both a pretest and posttest to determine relative difficulty of the concepts among college students. The three most challenging concepts were random origin of variation, how populations change over time due to changing proportions of alleles, and how new species originate. Many students chose distractors including need as a driving force. Results support the use of non-traditional methods as only students in such classes demonstrated any improvement on the CINS posttest. Pre- and posttesting with the CINS was also used to assess the relative effectiveness of using two types of supplemental reading materials: selections from narrative non-textbook sources or from other general biology textbooks in a general biology course. These results suggest that specific content of readings was more important than style of the readings. Implications for teaching both students and pre-service teachers are described.
