Friel,2020-05-13 This book brings together current information on the families that make up the kinesin superfamily of molecular motors in one comprehensive text an ideal reference for researchers looking to make comparisons between different families for specific information on an individual family or simply for an overview of the kinesin superfamily Information is clearly structured and grouped according to individual families and organised in a standardised way allowing the reader to easily search and retrieve information on this large superfamily of molecular motors and understand how its individual members carry out a diverse variety of cellular functions Features The first book dedicated to the entire kinesin superfamily Enables a fuller understanding of this family of proteins which is becoming an increasing focus of research due to its involvement in diseases such as cancer neuropathies and ciliopathies Written in a manner accessible to a range of researchers in the life and medical sciences including biophysicists biochemists and medical researchers Chapters 4 and 11 of this book are freely available as downloadable Open Access PDFs at <http://www.taylorfrancis.com> under a Creative Commons Attribution Non Commercial No Derivatives CC BY NC ND 4.0 license *The Army List for ...* Great Britain. Army,1875 *Remodeling of cardiac passive electrical properties and susceptibility to ventricular and atrial arrhythmias* George E. Billman,2015-09-25 The effective management of cardiac arrhythmias either of atrial or of ventricular origin remains a major challenge Sudden cardiac death due to ventricular tachyarrhythmias remains the leading cause of death in industrialized countries while atrial fibrillation is the most common rhythm disorder an arrhythmia that s prevalence is increasing and accounts for nearly one quarter of ischemic strokes the elderly population Yet despite the enormity of the problem effective therapeutic interventions remain elusive In fact several initially promising antiarrhythmic agents were found to increase rather than decrease mortality in patients recovering from myocardial infarction The question then is what went wrong why have these interventions proven to be so ineffective An obvious answer is the drugs were designed to attack the wrong therapeutic target Clearly targeting single ion channels using either isolated ion channels or single myocytes preparations has proven to be less than effective What then is the appropriate target It is well established that cardiac electrical properties can vary substantially between single cells and intact preparations One obvious example is the observation that action potential duration is much longer in isolated cells as compared to multi cellular preparations or intact hearts Due to the low electrical resistance between adjacent myocytes the

cells act in coordinated fashion producing electrotonic interdependence between neighboring cells Myocardial infarction and or acute ischemia provoke profound changes in the passive electrical properties of cardiac muscle In particular electrotonic uncoupling of the myocytes disrupts the coordinated activation and repolarization of cardiac tissue The resulting compensatory changes in ionic currents decrease cardiac electrical stability increasing the risk for life threatening changes in the cardiac rhythm Thus the electrical properties of myocardial cells must be considered as a unit rather than in isolation It is the purpose of this Research Topic to evaluate the largely neglected relationship between changes in passive electrical properties of cardiac muscle and arrhythmia formation Breckinridge William C.
