*On the feasibility of multi-leader replication in the early tiers* Jungnickel, Tim, 2018-09-27  
 In traditional service architectures that follow the service statelessness principle the state is primarily held in the data tier Here service operators utilize tailored storage solutions to guarantee the required availability even though failures can occur at any time This centralized approach to store and process an application's state in the data tier implies that outages of the entire tier cannot be tolerated An alternative approach which is in focus of this thesis is to decentralize the processing of state information and to use more stateful components in the early tiers The possibility to tolerate a temporary outage of an entire tier implies that the application's state can be manipulated by the remaining tiers without waiting for approval from the unavailable tier This setup requires multi leader replication where every replica can accept writes and forwards the resulting changes to the other replicas This thesis explores the feasibility of using multi leader replication to store and process state in a decentralized manner across multiple tiers To this end two replication mechanisms namely Conflict free Replicated Data Types and Operational Transformation are under particular investigation We use and extend both mechanism to demonstrate that the aforementioned decentralization is worth considering when designing a service architecture The challenges that arise when following our approach go back to fundamental impossibility results in distributed systems research i.e. the impossibility to achieve a fault tolerant consensus mechanism in asynchronous systems and the inevitable trade off between availability and

consistency in the presence of failures With this thesis we contribute to close the exposed gaps of both results by providing usable alternatives for standard IT services We exemplify the feasibility of our alternatives with a fully distributed IMAP service and a programming library that provides the necessary extension to utilize our approach in a variety of web based applications All contributions of this thesis are based on both theory and practice In particular all extensions to the existing multi leader replication mechanisms were proven to satisfy the necessary properties Moreover those extensions were also implemented as prototypical applications and evaluated against the corresponding de facto standard software from the industry Basierend auf dem service statelessness principle ist es blich Softwaredienste so zu entwerfen dass der Zustand des Dienstes prim r in einer gekapselten Datenschicht verarbeitet wird Innerhalb der Datenschicht werden spezielle L sungen verwendet um die Verf gbarkeit der Daten sicherzustellen Dieser zentralisierte Ansatz hat zur Folge dass ein Ausfall oder eine tempor re Nichtverf gbarkeit der gesamten Datenschicht zwangsweise zur Nichtverf gbarkeit des gesamten Dienstes f hrt Ein alternativer Ansatz welcher in dieser Arbeit erforscht wird ist die dezentralisierte Speicherung und Verarbeitung der Daten in den dar berliegenden Softwareschichten Um in diesem Ansatz einen Ausfall der gesamten Datenschicht zu kompensieren ist es zwingend notwendig dass die verbleibenden Schichten die eingehenden Anfragen ohne die Best tigung durch die Datenschicht beantworten k nnen Hierf r wird eine Replikationsarchitektur ben tigt in der jedes Replikat die Anfragen direkt beantworten kann die so genannte multi leader replication In dieser Arbeit werden diese Replikationsarchitekturen verwendet um den Zustand und die Daten eines Dienstes zu dezentralisieren und ber mehrere Schichten zu replizieren Hierbei werden zwei Mechanismen detaillierter betrachtet Conflict free Replicated Data Types und Operational Transformation Anschlie end werden beide Mechanismen erweitert und hinsichtlich der Verwendbarkeit f r den beschriebenen Ansatz gepr ft Als Ergebnis dieser Arbeit wird gezeigt dass ein dezentralisierter Ansatz mit den vorgestellten Mechanismen in Betracht gezogen werden kann Die Herausforderungen die bei der Anwendung dieses Ansatzes entstehen basieren auf nachweislich unl sbaren Problemen aus der Forschung von Verteilten Systemen Dazu geh rt die Unl sbarkeit von Konsensus und die unausweichliche Abw gung zwischen Verf gbarkeit und Konsistenz in einem verteilten System mit Aus fllen Diese Arbeit tr gt dazu bei die entstehenden L cken welche aus diesen fundamentalen Ergebnissen resultieren zu schlie en und die vorgeschlagenen L sungen f r reale IT Dienste anwendbar zu machen Dieses wird anhand eines dezentralen IMAP Dienstes und einer Programmierbibliothek f r Webanwendungen verdeutlicht Alle Bestandteile dieser Doktorarbeit verbinden Theorie und Praxis Alle vorgeschlagenen Erweiterungen f r bestehende Replikationssysteme werden in formalen Modellen verifiziert und prototypisch implementiert Die Implementierungen werden au erdem mit vergleichbarer Standardsoftware welche dem heutigen Stand der Technik entspricht in praktischen Experimenten evaluiert
