Limiting Using MPC: Theory and Application Daniel Simon,2017-09-12 Flight control design for modern fighter aircraft is a challenging task Aircraft are dynamical systems which naturally contain a variety of constraints and nonlinearities such as e g maximum permissible load factor angle of attack and control surface deflections Taking these limitations into account in the design of control systems is becoming increasingly important as the performance and complexity of the aircraft is constantly increasing The aeronautical industry has traditionally applied feedforward anti windup or similar techniques and different ad hoc engineering solutions to handle constraints on the aircraft However these approaches often rely on engineering experience and insight rather than a theoretical foundation and can often require a tremendous amount of time to tune In this thesis we investigate model predictive control as an alternative design tool to handle the constraints that arises in the flight control design We derive a simple reference tracking MPC algorithm for linear systems that build on the dual mode formulation with guaranteed stability and low complexity suitable for implementation in real time safety critical systems To reduce the computational burden of nonlinear model predictive control we propose a method to handle the nonlinear constraints using a set of dynamically generated local inner polytopic approximations The main benefit of the proposed method is that while computationally cheap it still can guarantee recursive feasibility and convergence An alternative to deriving MPC algorithms with guaranteed stability properties is to analyze the closed loop stability post design Here we focus on deriving a tool based on Mixed Integer Linear Programming for analysis of the closed loop stability and robust stability of linear systems controlled with MPC controllers To test the performance of model predictive control for a real world example we design and implement a standard MPC controller in the development simulator for the JAS 39 Gripen aircraft at Saab Aeronautics This part of the thesis focuses on practical and tuning aspects of designing MPC controllers for fighter aircraft Finally we have compared the MPC design with an alternative approach to maneuver limiting using a command governor **Catalog of Copyright Entries. Circuits and Systems Rob A. Rutenbar,Georges G. E. Gielen,2002-05-06 The tools and techniques you need to break the analog design bottleneck Ten years ago analog seemed to be a dead end technology Today System on Chip SoC designs are increasingly mixed signal designs With the advent of application specific integrated circuits ASIC technologies that can integrate both analog and digital functions on a single chip analog has become more crucial than ever to the design process

Today designers are moving beyond hand crafted one transistor at a time methods They are using new circuit and physical synthesis tools to design practical analog circuits new modeling and analysis tools to allow rapid exploration of system level alternatives and new simulation tools to provide accurate answers for analog circuit behaviors and interactions that were considered impossible to handle only a few years ago To give circuit designers and CAD professionals a better understanding of the history and the current state of the art in the field this volume collects in one place the essential set of analog CAD papers that form the foundation of today s new analog design automation tools Areas covered are Analog synthesis Symbolic analysis Analog layout Analog modeling and analysis Specialized analog simulation Circuit centering and yield optimization Circuit testing Computer Aided Design of Analog Integrated Circuits and Systems is the cutting edge reference that will be an invaluable resource for every semiconductor circuit designer and CAD professional who hopes to break the analog design bottleneck Computer Books and Serials in Print ,1985 **Design and Planning of Engineering Systems** Dale Dean
