Dickenstein, Ioannis Z. Emiris, 2005-12-29 The subject of this book is the solution of polynomial equations that is systems of generally non linear algebraic equations This study is at the heart of several areas of mathematics and its applications It has provided the motivation for advances in different branches of mathematics such as algebra geometry topology and numerical analysis In recent years an explosive development of algorithms and software has made it possible to solve many problems which had been intractable up to then and greatly expanded the areas of applications to include robotics machine vision signal processing structural molecular biology computer aided design and geometric modelling as well as certain areas of statistics optimization and game theory and biological networks At the same time symbolic computation has proved to be an invaluable tool for experimentation and conjecture in pure mathematics As a consequence the interest in effective algebraic geometry and computer algebra has extended well beyond its original constituency of pure and applied mathematicians and computer scientists to encompass many other scientists and engineers While the core of the subject remains algebraic geometry it also calls upon many other aspects of mathematics and theoretical computer science ranging from numerical methods differential equations and number theory to discrete geometry combinatorics and complexity theory

The goal of this book is to provide a general introduction to modern mathematical aspects in computing with multivariate polynomials

and in solving algebraic systems **Scientific and Technical Aerospace Reports** ,1984 **College Algebra** Cynthia Y. McNamee,V.Y. Pan,2013-07-19 The zeros of a polynomial can be readily recovered from its linear factors The linear factors can be approximated by first splitting a polynomial numerically into the product of its two nonconstant factors and then recursively splitting every computed nonlinear factor in similar fashion For both the worst and average case inputs the resulting algorithms solve the polynomial factorization and root finding problems within fixed sufficiently small error bounds by using nearly optimal arithmetic and Boolean time that is using nearly optimal numbers of arithmetic and bitwise operations in the case of a polynomial with integer coefficients and simple roots we can immediately extend factorization to root isolation that is to computing disjoint covering discs one for every root on the complex plane The presented algorithms compute highly accurate approximations to all roots nearly as fast as one reads the input coefficients Furthermore our algorithms allow processor efficient parallel acceleration which enables root finding factorization and root isolation in polylogarithmic arithmetic and Boolean time The chapter thoroughly covers the design and analysis of these algorithms including auxiliary techniques of independent interest At the end we compare the presented polynomial root finders with alternative ones in particular with the popular algorithms adopted by users based on supporting empirical information We also comment on some promising directions to further progress *na , The Elements of Mechanical Engineering* International Correspondence Schools,1900
