Gasoline Fuel Injector Spray Measurement and Characterization Gasoline Fuel Injection Standards Committee, 2007 This SAE Recommended Practice promotes uniformity in the characterization tests conducted on sprays generated by automotive fuel injectors used in both port fuel injection and gasoline direct injection engine applications SAE J2715 contains the detailed background procedures and data reduction protocols for nearly all fuel spray characterization metrics that are applicable to automotive applications It is intended to be utilized in conjunction with other SAE J documents that address injector performance metrics These are SAE J1832 for Port Fuel Injection and the forthcoming SAE J2713 for Gasoline Direct Injectors The rationale for this document is that fuel spray measurement and characterization continues to become increasingly critical to the automotive industry whereas no comprehensive industry wide set of measurement and reporting procedures has been available This has led to a situation in which many spray parameters and test procedures have of necessity been created and utilized within individual original equipment manufacturer OEM companies and even among third party testing laboratories and universities This non uniformity regarding test and reporting procedures has resulted in a lack of repeatability and traceability for many claimed spray parameters It has also made it very difficult for any laboratory to check the values of spray characterization parameters that are reported by another laboratory The lack of standardization has also resulted in considerable confusion and obfuscation regarding the names and definitions of spray parameters as they apply to port fuel injection and gasoline direct injection The current situation regarding the term cone angle for these two classes of injectors is a prime example The use of the uniform and well defined procedures for test configuration testing data reduction and reporting that are contained in this document should significantly enhance the ability of one spray test laboratory to accurately repeat and verify the results of another The very detailed procedures and test specifications for all of the spray parameters should also serve to reduce the variation of spray parameter values that are reported even for the same injector model This should in turn reduce the overall time and overhead for obtaining a proven fuel system for an engine as OEMs could ultimately conduct one set of spray tests per J2715 as opposed to a separate set of tests for each customer This document should also supply the industry with a neutral unbiased test for each defined spray parameter *Low Pressure*

Gasoline Fuel Injector Gasoline Fuel Injection Standards Committee, 2001 This SAE Recommended Practice promotes uniformity in the evaluation and qualification tests conducted on fuel injectors used in gasoline engine applications Its scope is limited to electronically actuated fuel injection devices used in automotive port or throttle body fuel injection systems where fuel supply pressure is below 1000 kPa It is primarily restricted to bench tests More specifically this document is intended for use as a guide to the following Standardize use of nomenclature specifically related to fuel injectors Identify and define those parameters that are used to measure fuel injector characteristics or performance The parameters included in this document are listed along with their recommended symbol where appropriate Closing Time CT Inductance L Coil Resistance R Dynamic Flow Qd Dynamic Flow Calculated Qdc Dynamic Flow Rate Q Dynamic Flow Temperature Shift Qtd Dynamic Flow Vacuum Shift Qvd Dynamic Minimum Operating Voltage DMOV Dynamic Set Point PWxx Dynamic Set Point Flow Qsp External Leakage Flow Offset Y Insulation Resistance IR Linear Flow Range LFR Linearity Deviation LD Maximum Overload Voltage Opening Time OT Operating Voltage Range Period P Pulse Width PW Pressure Drop Ratio PDR Repeatability Slope m Slope Approximated ma Spray Pattern Stability S Static Drop Out Current I S OFF Static Flow Rate Qs Static Minimum Operating Voltage SMOV Static Pull In Current I S ON Time Offset X Working Flow Range WFR Establish test procedures and recommend test equipment and methods to measure and quantify these parameters Establish test procedures and recommend test equipment and methods to quantify simulated field reliability over the life of the component Except where stated test results are recorded for individual parts under recommended test conditions Where population characteristics are reported the sample size selection method and analysis technique must be explicitly stated Any testing practices which are different than those recommended in this specification should be noted on the data collection sheet

Legacy Vehicle Fuel System Testing with Intermediate Ethanol Blends, 2012 The effects of E10 and E 17 on legacy fuel system components from three common mid 1990s vintage vehicle models Ford GM and Toyota were studied The fuel systems comprised a fuel sending unit with pump a fuel rail and integrated pressure regulator and the fuel injectors The fuel system components were characterized and then installed and tested in sample aging test rigs to simulate the exposure and operation of the fuel system components in an operating vehicle The fuel injectors were cycled with varying pulse widths during pump operation Operational performance such as fuel flow and pressure was monitored during the aging tests Both of the Toyota fuel pumps demonstrated some degradation in performance during testing Six injectors were tested in each aging rig The Ford and GM injectors showed little change over the aging tests Overall based on the results of both the fuel pump testing and the fuel injector testing no major failures were observed that could be attributed to E17 exposure The unknown fuel component histories add a large uncertainty to the aging tests Acquiring fuel system components from operational legacy vehicles would reduce the uncertainty
