Human Reproduction

Human reproduction

Human reproduction is sexual reproduction involving male and female reproductive cells called gametes. The reproductive system includes organs called gonads that produce gametes and hormones; ducts for transport, storage and transportation of gametes; accessory organs and glands for fluid secretion; and internal genitalia. Reproduction is regulated by hormones produced by the gonads, the hypothalamus and the pituitary gland. Fertilisation involves the introduction of sperm into the vagina. The sperm travels through the female reproductive tract until it encounters an ovum, a female sex cell. Fertilisation can then take place.

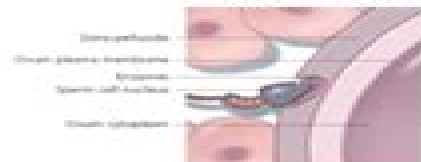

Male reproductive system

The adult male reproductive system is a complex of two primary external structures, the testes and the penis. The testes are divided into thousands of tiny compartments or lobules containing seminiferous tubules, tightly coiled structures where sperm formation takes place.

The testes are situated in a sac called the scrotum, which provides support and regulates the position of the testes relative to the body. The scrotum is located below the testes, near the perineum, an external compartment to maintain the proper temperature within the testes for sperm formation.

Seminiferous tubules produce sperm cells, which are transported to the epididymis, a structure located in the scrotum, responsible for maturing the sperm and initiating the sex organs and promoting the development of male secondary sex characteristics.

Fertilization

The upper portion of the vagina leads to the vaginal canal for fertilization. Millions of sperm travel through the female reproductive tract, utilizing coiled ducts to reach the egg. Within a sperm, the nucleus contains the genetic material. The sperm travels through the female reproductive tract, utilizing coiled ducts to reach the egg. Female reproductive system

The internal structure of the adult female reproductive system includes the vagina, uterus, ovaries and fallopian tubes. These structures form a pathway allowing the release of an egg cell, fertilization in sperm and delivery of a developed fetus. The vagina is a muscular canal that leads from the uterus to the outside of the body. It is the lower part of the uterus. It channels through the cervix allows the passage of sperm and menstrual discharge. The uterus is a hollow pear-shaped organ with muscular walls that contract during childbirth. The lower part of the uterus is the endometrium, which is the lining of the uterus. The endometrium is the lining of the uterus. The endometrium is the lining of the uterus. The endometrium is the lining of the uterus.

Spermatogenesis

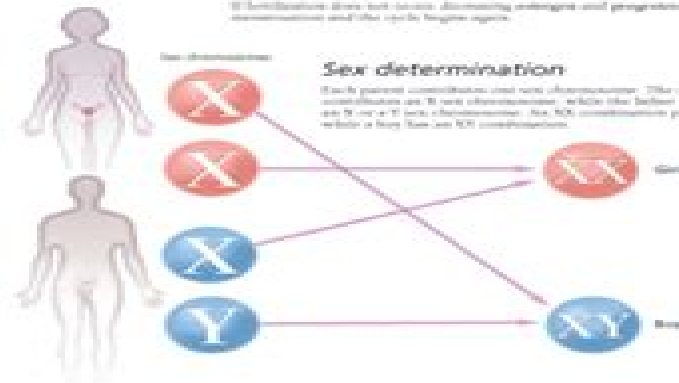

The ovaries, located on each side of the uterus, are responsible for producing ova as well as the female sex hormones estrogen and progesterone. Estrogen is responsible for the development of the female reproductive structures, sexual characteristics, and breast development. Progesterone prepares the uterus lining for implantation of a fertilized egg and is necessary for breast milk production. The ovaries are connected to the uterus by the fallopian tubes, narrow ducts that provide a passageway for the egg to reach the uterus.

Ovulation phases

Ovulation & the menstrual cycle

The menstrual cycle refers to the sequence of events that occurs in the endometrium, the lining of the uterus. The cycle normally lasts approximately 28 days. The purpose is to prepare the uterus for possible pregnancy. The menstrual cycle is governed by the endocrine system. It involves the release of ova and the shedding of the uterine lining.
