PHET simulation: [Shedding light: convex and concave mirrors and lenses](#)

PHET simulation: [Geometric Optics](#)

For flat, curved mirrors and lenses, geometric optics, understanding of:
convex/concave mirrors, lenses

How convex and the the concave lens mirror and lens work. How the light rays work. How convex mirrors, concave mirrors, lenses work.

TO DO

Light can be considered as a beam, or ray, that travels in straight lines if the size of wavelength (propagation) is less than the wavelength of the light. Light rays travel in straight lines unless they are reflected or refracted. If the light is reflected, it is reflected back into the medium from which it came. If the light is refracted, it is bent towards the normal. The normal is a line perpendicular to the surface of the medium. The angle of incidence is the angle between the incident ray and the normal. The angle of reflection is the angle between the reflected ray and the normal. The angle of refraction is the angle between the refracted ray and the normal. This process is called the law of reflection, and the law of refraction.

Law of Reflection is also known as the law of reflection, which states that the angle of incidence is equal to the angle of reflection. The angle of incidence is the angle between the incident ray and the normal. The angle of reflection is the angle between the reflected ray and the normal. This is true for all surfaces, whether they are smooth or rough. The law of reflection is also known as the law of reflection, and it is the basis for many optical devices, such as mirrors, lenses, and prisms.

It is also known as the law of reflection, which states that the angle of incidence is equal to the angle of reflection. This is true for all surfaces, whether they are smooth or rough.
