Assessing the Long-term Performance of Mechanically Stabilized Earth Walls

Travis M. Gerber,2012 Mechanically stabilized earth MSE walls are an important class of infrastructure assets whose long term

performance depends on various factors As with most all other classes of assets MSE walls need periodic inspection and assessment of performance To date some agencies have established MSE wall monitoring programs whereas others are looking for guidance tools and funding to establish their own monitoring programs The objective of this synthesis project is to determine how transportation agencies monitor assess and predict the long term performance of MSE walls The information used to develop this synthesis came from a literature review together with a survey and interviews Of the 52 U S and 12 Canadian targeted survey recipients 39 and five respectively responded This synthesis reveals that unlike bridges and pavements MSE walls and retaining walls in general are often overlooked as assets Fewer than one quarter of state level transportation agencies in the United States have developed some type of MSE wall inventory beyond that which may be captured as part of their bridge inventories Fewer still have the methods and means to populate their inventories with data from ongoing inspections from which assessments of wall performance can be made In the United States there is no widely used consistently applied system for managing MSE walls Wall inventory and monitoring practices vary between agencies This synthesis examines existing practices concerning the nature scope and extent of existing MSE wall inventories It also examines the collection of MSE wall data including the types of performance data collected how they are maintained in wall inventories and databases the frequency of inventory activities and assessment practices relevant to reinforcement corrosion and degradation Later parts of this synthesis discuss how MSE wall performance data are assessed interpreted and used in asset management decisions This synthesis finds that the most well implemented wall inventory and assessment system in the United States is the Wall Inventory Program developed by FHWA for the National Park Service However this system like some others uses condition narratives in a process that can be somewhat cumbersome and subjective Other systems use more direct numeric scales to describe wall conditions and an advantage of such systems is that they are often compatible with those used in assessments of bridges As experience with MSE walls accumulates agencies will likely continue to develop refine and better calibrate procedures affecting design construction condition assessment and asset management decisions One portion of this synthesis is dedicated to summarizing the actions taken thus far by survey respondents to improve the long term performance of their MSE walls Many agencies prescribe the use of a pre approved wall design and or wall supplier Other actions or policies frequently focus on drainage related issues Summary **Statistics and Management P**

FUNDAMENTALS OF MACHINE LEARNING TECHNIQUES Mr. Dayakar Babu

Kancherla,Ishita Arora,Maher Ali Rusho,Tasriqul Islam,2024-01-10 Machine learning is a subfield of computing science that

evolved both from the knowledge obtained through the process of learning how to classify data based on that understanding and also from the understanding gained through the process of learning the computational based concepts of Artificial Intelligence or AI Machine learning also known as ML is a common abbreviation for the field To put it another way machine learning is the process of training computers to learn on their own via their interactions with data without being explicitly taught to do so This is accomplished through the use of artificial neural networks Both humans and animals may claim to be the first to conceptualize what we now call learning There are a lot of similarities to be discovered between the way that machines learn and the way animals learn In point of fact many of the methods that are now used in machine learning were first created to imitate the foundations of animal and human learning using computer representations This was done to further the field of artificial intelligence The basic scientific concept of habituation for instance outlines the process by which an animal progressively ceases reacting to a stimulus that has been repeatedly shown to the animal If a dog is taught to perform a range of tasks such as rolling over sitting picking up objects etc it is considered to be an outstanding example of animal learning since it is capable of considerable learning if it is trained to do so If a dog is taught to execute a number of tasks such as rolling over sitting picking up items etc it is considered to be an excellent example of animal learning Many people believe that dogs are the best representatives of animal intelligence As opposed to the preceding example of successful learning there aren't many real world applications of machine learning that we can point to as evidence that it's a helpful notion in the current world This is in contrast to the earlier demonstration of successful learning Virtual personal assistants traffic predictions using GPS navigation surveillance of multiple cameras by AI to detect crime or unusual behavior of people social media uses ML for face recognition and news feed personalization search engine result refinement e mail spam filtering where a machine memorize all the previously labeled spam e mails by the user and a lot more applications are just some of the many places where ML is widely used Other applications include a lot more applications By using all of these applications it has become abundantly evident that making use of knowledge and experience that one already has will result in a more efficient learning process The close link that ML has to computational statistics which also plays a vital role makes the process of making predictions more simpler and more straightforward Everyone is entitled to wonder why does a machine need to learn something and there is no wrong answer to this question There are just a few compelling arguments in favor of the need of machine learning The fact that we just said that the development of learning capabilities in robots may help us better understand how animals and people gain information should not come as a surprise to anybody
