

### Experiment no 09.

**AIM:** To conduct experiment of trifilar suspension.

**APPARATUS REQUIRED:** Main frame, Trifilar suspension, Weights, Stopwatch, Thread.

#### INTRODUCTION:

**Trifilar Suspension (Torsional Pendulum) :-** It is also used to find the moment of inertia of a body experimentally. The body (say a disc or flywheel) whose moment of inertia is to be determined is suspended by three long flexible wires A, B and C, as shown in fig.-b. When the body is twisted about its axis through a small angle  $\theta$  and then released, it will oscillate with simple harmonic motion. Trifilar suspension is a disc of mass  $m$  (weight  $w$ ) suspended by three vertical cords, each of length  $l$ , from a fixed support. Each cord is symmetrically attached to the disc at the same distance  $r$  from the mass of the disc.

#### THEORY:

The disc is now turned through a small angle its vertical axis, the cords become inclined. On being released the disc will perform oscillations about the vertical axis. At any instant

Let:  $\theta$  = angular displacement of the disc

$F$  = tension in each cord  $= w/3$

Inertia torque  $= I \times \alpha$

Restoring torque  $= 3 \times \text{horizontal component forces of each string} \times r$

Inertia torque = restoring torque
