**Performance Enhancements in a Frequency Hopping GSM Network** Thomas Toftegaard Nielsen, Jeroen Wigard, 2007-05-08 Due to the explosive global growth in the number of mobile subscribers as well as the growth predicted in the mobile data segment, the need for improved spectrum efficiency on the radio interface becomes more and more important. Frequency hopping (FH) is an effective method for improving the spectrum efficiency. One of the advantages of FH is that it can be combined with other spectral efficiency improving features like power control, handover, and reuse partitioning. Performance Enhancements in a Frequency Hopping GSM Network covers FH and some of the additional features in detail. It begins with an in-depth description of the basic concept of FH on link level as well as on system level. Different methods have been used for analysis such as link level simulations, network level simulations, and classic teletraffic theory. Special features of Performance Enhancements in a Frequency Hopping GSM Network combine the practical experiences of operator and vendor with more theoretical research methods. An in-depth treatment of prevailing problems in GSM networks. Presentation of a new method, computer-aided network design (CAND), which has been developed to analyse the complex network structures of a GSM network. CAND provides the possibility for more realistic performance evaluations than conventional methods. Provides GSM-specific analysis of functionality improvements in power control, discontinuous transmission, and several handover algorithms. Explanation of the quality and capacity gains of features like the combination of FH and reuse partitioning, referred to as intelligent frequency hopping. A frequency planning method for FH GSM networks is presented. This method exploits the benefits from FH directly in the allocation process, increasing the overall frequency plan.
