**Misadventures in Health Care** Marilyn Sue Bogner, 2003-09-12 Misadventures in Health Care Inside Stories presents an alternative approach to attributing the cause of medical error solely to the health care provider That alternative the systems approach pursues why an incident occurs in terms of factors in the context of care that affect the care provider to induce an error The basis for this approach is the fact that an error is an act an act is behavior and behavior is a function of the person interacting with the environment Eleven vignettes illustrate the importance of the systems approach by describing health care incidents from the perspective of the care providers the perspective that can identify the factors that actually affect the provider These stories provide general readers with opportunities to apply their knowledge in analyzing incidents to identify error inducing factors This book is important reading for policymakers researchers and practitioners in law and in all medical specialties and professionals in the social sciences human factors and engineering In addition to sensitizing the reader to the importance of contextual factors in error Misadventures in Health Care is a case study reference to supplement texts in professional schools such as law and medicine as well as the full range of academic disciplines It also is important reading for the general public because it presents an approach for addressing a very pressing social problem that of misadventures in health care

**Clinical Benefits of Leukodepleted Blood Products** Joseph Sweeney, 2013-06-29 Joseph Sweeney Andrew Heaton the presence of allogeneic leukocytes in blood products received little T attention until the mid 1950s when these passenger cells were implicated in the etiology of febrile transfusion reactions and early strategies based on centrifugation were developed to effect their removal In recent decades and particularly in the past five years there has been an accumulation of literature implicating leukocytes in a wide variety of undesirable reactions to blood transfusion White cells are the least numerous of the cellular elements in blood and ratios of white cells to platelets and white cells to red cells are approximately 1 15 to 1 1000 respectively This ratio is maintained in whole blood but may be altered slightly in the process of component preparation Any production or processing step which intentionally decreases this ratio will result in a product which can be described as white cell depleted It has however become more common to define the outcome as a residual white cell content rather than a decrease in cellular ratios although the latter makes more sense on theoretical grounds since depletion of white cells needs to be put in the context of any unintentional loss of red cells or platelets The end result of this intentional processing step therefore is generally expressed as the residual absolute number of white cells or as the degree of difference

in white cell content the latter expressed as either a percentage change or as a logarithmic reduction
