HP Data Protector architecture

Steps for a successful implementation

A successful implementation of a backup and recovery strategy requires you to consider many factors. The points listed below are based on experience from a practical application, collected from many customers (SMBs and corporate groups), examining major aspects from planning to regular operation. The steps are divided into logical groups, so you can easily use this document as a reference for your own implementation of HP Data Protector (referred to in this guide as DP).

Note: The details specified apply mostly to a Microsoft Windows environment, but are applicable to other settings and approaches, and can be used as a template for further improvement in your own environment.

Backup and recovery strategy

A stable and functioning backup and recovery environment is a critical part of a high-performing organization. With a solid data backup system in place, when loss of data occurs, it can be restored within a previously defined timeframe regardless of the cause: inadvertently or deliberately deleted, corrupted due to errors in applications, a hacker attack, data lost due to hardware errors, or other reasons. Another aspect of backup and recovery is the necessity to restore historical data, for example due to legally prescribed requirements.

Regular backups are a simple form of disaster preparedness. Backups alone, however, are not a disaster recovery plan. The infrastructure of your organization also has to be examined. For instance, consider the following:

- Do you have an alternative data center?
- Are critical applications configured in a cluster?
- Is the network connection configured as redundant?
