

Applications of Area, Length and Distance

1. A sector of a circle is a region of the circle bounded by a central angle and the corresponding arc.

As proportional relationships exist between the central angle bounding the sector and the complete circle, these have previously determined relationships that could be used to predict that arc length of a circle is directly $\propto$ (proportional) central angle values or diameter of a circle. This function gives the formula for arc length of a circle of radius r in given degree.

$$\text{Arc Length} = \frac{\theta}{360} (\text{circumference of circle})$$

Another way to find given length is to think about unit π , where circumference. As you collected that the given radius in this previous activity, you determined that arc length is directly $\propto$ (proportional) to radius of the circle's circumference. This has been expressed in terms of π . This relationship can be summarized proportionally as circle of any given radius, r , is written

$$\frac{\text{Arc Length}}{r} = \frac{\text{Circumference of Circle}}{r}$$

Similarly, you determined a function that could be used to predict the arc length by a central angle in a circle of radius of diameter of radius r .

$$\text{Arc Length for length of Radius} = \frac{\theta}{360} (\text{circumference of circle})$$

As you collected that for given radius in this previous activity, you determined that, the arc length, area of a circle (or area swept) is proportional to the circle's circumference can be expressed in terms of π . This relationship is summarized proportionally for a circle of any given radius, r is written

$$\frac{\text{Arc Length}}{r} = \frac{\text{Circumference of Circle}}{r}$$

Example: (Based on previous activity and necessary.)

1. If the radius of a circle is 10 cm and the angle is 60 degrees, find the arc length and area of the sector.
