Handbook For Robustness Validation Of Automotive Electrical:

Handbook for Robustness Validation of Automotive Electrical/electronic Modules ,2008 *Handbook for Robustness Validation of Automotive Electrical/Electronic Modules* Automotive Electronic Systems Reliability Standards,2012 This document addresses robustness of electrical electronic modules for use in automotive applications Where practical methods of extrinsic reliability detection and prevention will also be addressed This document primarily deals with electrical electronic modules EEMs but can easily be adapted for use on mechatronics sensors actuators and switches EEM qualification is the main scope of this document Other procedures addressing random failures are specifically addressed in the CPI Component Process Interaction section 10 This document is to be used within the context of the Zero Defect concept for component manufacturing and product use It is recommended that the robustness of semiconductor devices and other components used in the EEM be assured using SAE J1879 OCT2007 Handbook for Robustness Validation of Semiconductor Devices in Automotive Applications The emphasis of this document is on hardware and manufacturing failure mechanisms however other contemporary issues as shown in Figure 1 need to be addressed for a thorough Robustness Validation A Pareto of contemporary issues is shown in Figure 1 Although this document addresses many of the issues shown however some are outside the scope of this document and will need to be addressed for a thorough RV process application Examples of issues outside the scope of this document are system interactions interfaces functionality HMI Human Machine Interface and software At the time of publication of this handbook a system level Robustness Validation handbook which addresses these issues had been initiated In late 2006 Members of the SAE International Automotive Electronic Systems Reliability Standards Committee and ZVEI German Electrical and Electronic Manufacturers Association formed a joint task force to update SAE Recommended Practice J1211 NOV1978 Recommended Environmental Practices for Electronic Equipment Design The 1978 of version of SAE J1211 was written in an era when electronics were first being introduced to the automobile There was a high level of concern that the harsh environmental conditions experienced in locations in the vehicle could have a serious negative affect on the reliability of electronic components and systems Some early engine control modules ECMs had failure rates in the 350 failures per million hours f 106 hrs range or expressed in the customer s terms a 25% probability of failure in the first 12 months of vehicle ownership At that time warranty data was presented in R 100 repairs per 100 vehicles units for example 25 R 100 at 12 months In these early years when the automotive electronics industry was in it s infancy a large percentage of these were hard catastrophic and intermittent failures exacerbated by exposure to environmental extremes of temperature 40 C to 85 C high mechanical loads from rough road vibration and rail shipment mechanical shocks of up to 100g from handling and crash impact severe electrical transients electrostatic discharge and electromagnetic interference large swings in electrical supply voltage reverse electrical supply voltage and exposure to highly corrosive chemicals e g road salt and battery acid The focus of the 1978 version of J1211 was on

characterizing these harsh vehicle environment for areas of the vehicle engine compartment instrument panel passenger compartment truck under body etc and suggesting lab test methods which design engineers could use to evaluate the performance of their components and systems at or near the worst case conditions expected in the area of the vehicle where their electrical electronic components would be mounted By testing their prototypes at the worst case conditions i e at the product s specification limits described in the 1978 version of J1211 designers were able to detect and design out weaknesses and thereby reduce the likelihood of failure due to environmental factors By the mid 1980s it became common practice to specify test to pass zero failures allowed environmental conditions based reliability demonstration life tests with acceptance levels in the 90% to 95% reliability range with confidence levels of 70% to 90% This translates to approximately 5 to 20 f 106 hrs The sample size for these tests was determined using binomial distribution statistical tables and this would result in a requirement to test 6 to 24 test units without experiencing a failure If a failure occurred the sample size would have to be increased and the testing continued without another failure till the bogie was reached The environmental conditions during the test were typically defined such that the units under test were operated at specification limits based on J1211 recommended practices e g 40 C and 85 C for at least some portion of the total test time The goal of passing such a demonstration test was often very challenging and the test analyze fix programs that resulted although very time consuming and expensive produced much needed reliability growth Reliability improved significantly in the late 1980s and early 1990s and vehicle manufactures and their suppliers began expressing warranty data in R 1000 units instead of R 100 units By the turn of the century automobile warranty periods had increased from 12 months to 3 4 5 and even 10 years for some systems and most manufacturers had started specifying life expectancies for vehicle components of 10 15 and sometimes 20 years And by this time several vehicle manufacturers and their best electrical electronic component suppliers had improved reliability to the point where warranty data was being expressed in parts per million ppm in the triple double and even single digit range This translates to failure rates in the 0 05 f 106 hrs range and better The achievement of such high reliability is not the result of test to pass reliability demonstration testing based on binomial distribution statistical tables With this method reliability demonstration in the 99 99% to 99 9999% range would require thousands of test units On the contrary the methods and techniques used by engineering teams achieving such reliability excellence did not require increasingly large sample sizes more expensive and lengthy testing or more engineers It is about working smarter not harder and about systems level robust design and robustness validation thinking rather than component level test to pass thinking The task force leaders and members were of the strong opinion that the 2008 version of SAE J1211 should document the state of the art methods and techniques being used by leading companies and engineering teams to achieve ultra high reliability while at the same time reducing overall cost life cycle and shortening time to market The SAE International Automotive Electronic Systems Reliability Standards Committee and ZVEI German Electrical and Electronic Manufacturers Association are hopeful

that this Handbook for Robustness Validation of Automotive Electrical Electronic Modules will help many companies and engineering teams make the transition from the 1980s cookbook reliability demonstration approach to a more effective economically feasible knowledge based Robustness Validation approach Relevant information and data from SAE J1211 NOV1978 is preserved in SAE J2837 Environmental Conditions and Design Practices for Automotive Electronic Equipment Reference Data from SAE J1211 NOV1978

The Safety of Controllers, Sensors, and Actuators Juan Pimentel, 2019-03-07 Safety has been ranked as the number one concern for the acceptance and adoption of automated vehicles since safety has driven some of the most complex requirements in the development of self driving vehicles Recent fatal accidents involving self driving vehicles have uncovered issues in the way some automated vehicle companies approach

the design testing verification and validation of their products Traditionally automotive safety follows functional safety concepts as detailed in the standard ISO 26262 However automated driving safety goes beyond this standard and includes other safety concepts such as safety of the intended functionality SOTIF and multi agent safety The Safety of Controllers Sensors and Actuators addresses the concept of safety for self driving vehicles through the inclusion of 10 recent and highly relevant SAE technical papers Topics that these papers feature include risk reduction techniques in semiconductor based systems component certification and safety assessment and audits for vehicle components As the fifth title in a series on automated vehicle safety this contains introductory content by the Editor with 10 SAE technical papers specifically chosen to illuminate the specific safety topic of that book

Handbook for Robustness Validation of Semiconductor Devices in Automotive Applications Automotive Electronic Systems Reliability Standards, 2007 This document will primarily address intrinsic reliability of electronic components for use in automotive electronics Where practical methods of extrinsic reliability detection and prevention will also be addressed This document primarily deals with integrated circuit issues but can easily be adapted for use in discrete or passive component qualification with the generation of a list of failure mechanisms relevant to those devices Component qualification is the main scope of this document Other procedures addressing extrinsic defects are specifically addressed in the monitoring chapter This document is to be used within the context of achieving Zero Defect in component manufacturing and product use NOTE The term shall indicate a binding requirement Members of SAE International Automotive Electronic Systems Reliability Standards Committee ZVEI German Electrical and Electronic Manufacturers Association AEC Automotive Electronics Council and JSAE Japanese Society of Automotive Engineers formed a joint task force and met to update SAE Recommended Practice J1879 October 1988 General Qualification and Production Acceptance Criteria for Integrated Circuits in Automotive Applications This version did not describe methods to demonstrate that a device under test would meet the customer demand for failure levels in the single digit parts per million ppm range Additionally with the old qualification test to pass approach there is very little knowledge generated about the relevant component failure mechanisms that may occur at the boundaries of the specification limits Extending the old approach to single digit ppm levels is unfeasible with respect to both economics and time A new knowledge based approach to understanding and preventing the occurrence of the relevant component failure mechanisms was required The joint task force concluded that the J1879 Recommended Practice should be revised to encompass a Robustness Validation approach and that an Automotive Electronics Robustness Validation Handbook should be published This handbook is based on information from a wide number of sources including international Automotive OEMs and their full supply chain engineering societies and other related organizations

Advanced Microsystems for Automotive Applications 2009 Gereon Meyer, Jürgen Valldorf, Wolfgang Gessner, 2009-04-15 The current economic crisis is cutting the automotive sector to the quick Public authorities worldwide are now faced with requests for providing loans and accepting guarantees and even for

putting large automotive companies under state control Assessing the long term benefits of such help and weighing the needs of different sectors against each other poses a major challenge for the national policies Given the upcoming change of customer preferences and state regulations towards safety sustainability and comfort of a car the automotive industry is particularly called to prove its ability to make necessary innovations available in order to accelerate its pace to come out of the crisis Consequently the Green Car is assuming a prominent role in the current debate Various power train concepts are currently under discussion for the Green Car including extremely optimised internal combustion engines hybrid drives and battery electric traction Electrical cars are the most appealing option because they are free of local emissions and provide the opportunity to use primary energy from sources other than crude oil for transport Well to wheel analysis show that their green house gas emissions can be rated negligibly small if electricity from renewable sources like wind and solar is used
