**Embedded Operating System Projects** Hentschel, Uwe, Richter, Daniel, Polze, Andreas, 2014 In today's life embedded systems are ubiquitous But they differ from traditional desktop systems in many aspects these include predictable timing behavior real time the management of scarce resources memory network reliable communication protocols energy management special purpose user interfaces headless operation system configuration programming languages to support software hardware co design and modeling techniques Within this technical report authors present results from the lecture Operating Systems for Embedded Computing that has been offered by the Operating Systems and Middleware group at HPI in Winter term 2013 14 Focus of the lecture and accompanying projects was on principles of real time computing Students had the chance to gather practical experience with a number of different OSes and applications and present experiences with near hardware programming Projects address the entire spectrum from bare metal programming to harnessing a real time OS to exercising the full software hardware co design cycle Three outstanding projects are at the heart of this technical report Project 1 focuses on the development of a bare metal operating system for LEGO Mindstorms EV3 While still a toy it comes with a powerful ARM processor 64 MB of main memory standard

interfaces such as Bluetooth and network protocol stacks EV3 runs a version of 1.1 Introduction Linux Sources are available from Lego's web site However many devices and their driver software are proprietary and not well documented Developing a new bare metal OS for the EV3 requires an understanding of the EV3 boot process Since no standard input/output devices are available initial debugging steps are tedious After managing these initial steps the project was able to adapt device drivers for a few Lego devices to an extent that a demonstrator the Segway application could be successfully run on the new OS Project 2 looks at the EV3 from a different angle The EV3 is running a pretty decent version of Linux in principle the RT\_PREEMPT patch can turn any Linux system into a real time OS by modifying the behavior of a number of synchronization constructs at the heart of the OS Priority inversion is a problem that is solved by protocols such as priority inheritance or priority ceiling Real time OSes implement at least one of the protocols The central idea of the project was the comparison of non real time and real time variants of Linux on the EV3 hardware A task set that showed effects of priority inversion on standard EV3 Linux would operate flawlessly on the Linux version with the RT\_PREEMPT patch applied If only patching Lego's version of Linux was that easy Project 3 takes the notion of real time computing more seriously The application scenario was centered around our Carrera Digital 132 racetrack Obtaining position information from the track controlling individual cars detecting and modifying the Carrera Digital protocol required design and implementation of custom controller hardware What to implement in hardware firmware and what to implement in application software this was the central question addressed by the project
