Combustion Engines Development Günter P. Merker,Christian Schwarz,Rüdiger Teichmann,2011-09-24 Combustion Engines Development nowadays is based on simulation not only of the transient reaction of vehicles or of the complete driveshaft but also of the highly unsteady processes in the carburation process and the combustion chamber of an engine Different physical and chemical approaches are described to show the potentials and limits of the models used for simulation

La Modélisation multidimensionnelle des écoulements dans les moteurs Thierry Baritaud,1999 With an increasingly challenging commercial environment and the need imposed by safety principles to reduce both fuel consumption and pollutant emissions the development of new engines can now benefit from the advances of computational fluid dynamics Engine CFD is a most challenging simulation problem This is caused by the spread of time and space scales the excursion amplitude of most parameters the high quasi cyclic unstationarity of engine flows the importance of minor geometry details the number of physical and chemical processes including turbulent combustion and multi phase flows to model However engine CFD has now reached a state where it has become a widely used tool not only for engine understanding but also increasingly for engine design Undoubtedly laser diagnostics in optical access engines have also brought significant help

Modeling of End-Gas Autoignition for Knock Prediction in Gasoline Engines Andreas Manz, 2016-08-18 Downsizing of modern gasoline engines with direct injection is a key concept for achieving future CO₂ emission targets However high power densities and optimum efficiency are limited by an uncontrolled autoignition of the unburned air fuel mixture the so called spark knock phenomena By a combination of three dimensional Computational Fluid Dynamics 3D CFD and experiments incorporating optical diagnostics this work presents an integral approach for predicting combustion and autoignition in Spark Ignition SI engines The turbulent premixed combustion and flame front propagation in 3D CFD is modeled with the G equation combustion model i e a laminar flamelet approach in combination with the level set method Autoignition in the unburned gas zone is modeled with the Shell model based on reduced chemical reactions using optimized reaction rate coefficients for different octane numbers ON as well as engine relevant pressures temperatures and EGR rates The basic functionality and sensitivities of improved sub models e g laminar flame speed are proven in simplified test cases followed by adequate engine test cases It is shown that the G equation combustion model performs well even on unstructured grids with polyhedral cells and coarse grid resolution The validation of the knock model with respect to temporal and spatial knock onset is done with fiber optical spark plug measurements and statistical

evaluation of individual knocking cycles with a frequency based pressure analysis The results show a good correlation with the Shell autoignition relevant species in the simulation The combined model approach with G equation and Shell autoignition in an active formulation enables a realistic representation of thin flame fronts and hence the thermodynamic conditions prior to knocking by taking into account the ignition chemistry in unburned gas temperature fluctuations and self acceleration effects due to pre reactions By the modeling approach and simulation methodology presented in this work the overall predictive capability for the virtual development of future knockproof SI engines is improved
