

## SeisWorks® Horizon Input

---

**SeisWorks® Horizon Input** imports interpreted horizon files directly from the SeisWorks® horizons stored in the legacy OpenWorks® (version 2003.12.X) database and saves them as ProMAX® horizon tables.

**Note:** To read and write R5000 version SeisWorks® horizons, use the SeisSpace® R5000 tools.

In order to use **SeisWorks® Horizon Input**, you must have a valid OpenWorks® license.

### Theory

SeisWorks® horizons are read directly from the legacy OpenWorks® (version 2003.12.X) interpretation database and saved as ProMAX® horizon tables within the Area and Line in which the **SeisWorks® Horizon Input** process is executed.

To ensure that a pick is available for every trace within the SeisWorks® database, it is usually desirable to perform a global snap of all horizons within the SeisWorks® software prior to importing them. In the case of large datasets, such as those in excess of 10,000 lines, it may be necessary to import the SeisWorks® horizon file from sub-sets of lines within the SeisWorks® project. You are therefore presented the option of selecting the lines from which interpretations should be imported.

In addition, you are permitted to decimate the incoming table when using **SeisWorks® Horizon Input**. Once in the ProMAX® system, picks can always be snapped in order to get picks output for every trace. This is usually desirable when using such processes as **Sequence Attribute Analysis (SAA)**.

**Note:** Decimating the horizon table has virtually no effect on **Sequence Attribute Analysis** run times, and is therefore not recommended. The most effective way to reduce **SAA** run times is to decimate the number of traces being imported via **SeisWorks® Seismic Input**.
