Topological Interactions in Ring Polymers Davide Michieletto, 2016-06-25 Ring polymers are one of the last big mysteries in polymer physics and this thesis tackles the problem of describing their behaviour when interacting in dense solutions and with complex environments and reports key findings that help shed light on these complex issues The systems investigated are not restricted to artificial polymer systems but also cover biologically inspired ensembles contributing to the broad applicability and interest of the conclusions reached One of the most remarkable findings is the unambiguous evidence that rings interpenetrate when in dense solutions here this behaviour is shown to lead to the emergence of a glassy state solely driven by the topology of the constituents This novel glassy state is unconventional in its nature and thanks to its universal properties inherited from polymer physics will attract the attention of a wide range of physicists in the years to come

*Adam Smith's Invisible Hand as Self-control Mechanism of Social Structures* Tadeusz Szuba, 2022-11-07 This book shows how such a computational process functions how great is its power and versatility since it is possible to show how discoveries are made In 1759 Adam Smith realized that there must exist an additional powerful control mechanism behind Great Britain's authority and government explaining the extraordinary successes of Great Britain He called this the Invisible Hand Despite having used this term only 3 times the idea evokes extreme scientific and political emotions to this day If we apply a molecular model of computation such as in in Adleman's DNA computer a computational model for the Invisible Hand can be built to show how it affects a society It is a spontaneous unconscious distributed noncontinuous computational process on the platform of minds of e.g. people or ants Knowing this mechanism a future self-steering and self-optimization system for AI
