*Getting to the Common Core* Sharon L. Spencer, Sandra Vavra, 2015-01-01 The Common Core Standards have recently been adopted in most states across the nation and teachers are in the process of getting to the core of these standards Teaching to standards is not a new concept teachers have adapted to new standards every few years for quite some time And teachers are adaptable as can be seen in this book We are writing this book to demonstrate how teachers use research based strategies to meet Common Core Standards while still focusing on students Our goal is to help teachers visualize students in action as other teachers describe the implementation of research based strategies in their own classrooms show student work samples and provide reflections of student success in achieving the standards Many Common Core Standards books focus on the standards but our approach focuses on strategies that engage the students in the classroom showing how different teachers at varying grade levels have used the strategies to meet the standards With this focus we believe that teachers gain a new and positive perspective on approaching the new standards and see the flexibility of strategies for meeting standards across subject areas We have examined research on the strategies with the purpose of giving teachers a brief description of why these strategies work before giving actual examples from classrooms We also work closely with teachers in the public schools and have our finger on the pulse of what is happening in the public schools one of the current stressors being unpacking the Common Core Standards This book actually focuses on practice We begin by laying out a rationale in our first chapter The Core Values of Education Then each chapter focuses on a strategy including 1 a brief description about the research supporting each strategy and 2 several examples from different grade levels which include a description of how the strategy was used student work samples and a reflection on the use of the strategy The research descriptions are fairly short because while we believe professional educators aka teachers in this case should know the research that supports practice we know they are not typically interested in long diatribes about the research

*Constant-Scale Natural Boundary Mapping to Reveal Global and Cosmic Processes* Pamela Elizabeth Clark, Chuck Clark, 2013-09-06 Whereas conventional maps can be expressed as outward expanding formulae with well defined central features and relatively poorly defined edges Constant Scale Natural Boundary CSNB maps have well defined boundaries that result from natural processes and thus allow spatial and dynamic relationships to be observed in a new way useful to understanding these processes CSNB mapping presents a new approach to visualization that produces maps markedly different from those produced by conventional cartographic methods In this approach any body can be represented by a 3D coordinate system For a regular body with its surface relatively smooth on the scale of its size locations of features can be represented by definite geographic grid latitude and longitude and elevation or deviation from the triaxial ellipsoid defined surface A continuous surface on this body can be segmented its distinctive regional terranes enclosed and their inter relationships defined by using selected morphologically identifiable relief features e g continental divides plate boundaries river or current systems In this way regions of distinction on a large essentially spherical body can be mapped as two dimensional facets with their boundaries representing regional to global scale asymmetries e g continental crust continental and oceanic crust on the Earth farside original thicker crust and nearside thinner impact punctuated crust on the Moon In an analogous manner an irregular object such as an asteroid with a surface that is rough on the scale of its size would be logically segmented along edges of its impact generated faces Bounded faces are imagined with hinges at occasional points along boundaries resulting in a foldable shape model Thus bounded faces grow organically out of the most compelling natural features Obvious boundaries control the map's extremities and peripheral regions are not dismembered or grossly distorted as in conventional map projections 2D maps and 3D models grow out of an object's most obvious face or terrane edges instead of arbitrarily by imposing a regular grid system or using regularly shaped facets to represent an irregular surface
