Growth Patterns in Physical Sciences and Biology

Jaun-Manuel Garcia-Ruiz, Enrique Louis, P. Meakin, Leonard M. Sander, 2012-12-06 During the past decade interest in the formation of complex disordered patterns far from equilibrium has grown rapidly This interest has been stimulated by the development of new approaches based primarily on fractal geometry to the quantitative description of complex structures increased understanding of non linear phenomena and the introduction of a variety of models such as the diffusion limited aggregation model that provide paradigms for non equilibrium growth phenomena Advances in computer technology have played a crucial role in both the experimental and theoretical aspects of this enterprise Substantial progress has been made towards the development of comprehensive understanding of non equilibrium growth phenomena but most of our current understanding is based on simple computer models Pattern formation processes are important in almost all areas of science and technology and clearly pattern growth pervades biology Very often remarkably similar patterns are found in quite diverse systems In some case dielectric breakdown electrodeposition fluid fluid displacement in porous media dissolution patterns and random dendritic growth for example the underlying causes of this similarity is quite well understood In other cases vascular trees nerve cells and river networks for example we do not yet know if a fundamental relationship exists between the mechanisms leading the formation of these structures

Spatial Simulation David O'Sullivan, George L. W. Perry, 2013-09-10 A ground up approach to explaining dynamic spatial modelling for an interdisciplinary audience Across broad areas of the environmental and social sciences simulation models are an important way to study systems inaccessible to scientific experimental and observational methods and also an essential complement to those more conventional approaches The contemporary research literature is teeming with abstract simulation models whose presentation is mathematically demanding and requires a high level of knowledge of quantitative and computational methods and approaches Furthermore simulation models designed to represent specific systems and phenomena are often complicated and as a result difficult to reconstruct from their descriptions in the literature This book aims to provide a practical and accessible account of dynamic spatial modelling while also equipping readers with a sound conceptual foundation in the subject and a useful introduction to the wide ranging literature *Spatial Simulation Exploring Pattern and Process* is organised around the idea that a small number of spatial processes underlie the wide variety of dynamic spatial models Its central focus on three building blocks of dynamic spatial models forces of attraction and segregation individual mobile entities and

processes of spread guides the reader to an understanding of the basis of many of the complicated models found in the research literature. The three building block models are presented in their simplest form and are progressively elaborated and related to real world process that can be represented using them. Introductory chapters cover essential background topics particularly the relationships between pattern process and spatiotemporal scale. Additional chapters consider how time and space can be represented in more complicated models and methods for the analysis and evaluation of models. Finally the three building block models are woven together in a more elaborate example to show how a complicated model can be assembled from relatively simple components. To aid understanding more than 50 specific models described in the book are available online at patternandprocess.org for exploration in the freely available Netlogo platform. This book encourages readers to develop intuition for the abstract types of model that are likely to be appropriate for application in any specific context. *Spatial Simulation Exploring Pattern and Process* will be of interest to undergraduate and graduate students taking courses in environmental social ecological and geographical disciplines. Researchers and professionals who require a non specialist introduction will also find this book an invaluable guide to dynamic spatial simulation.

A Non-Random Walk Down Wall Street Andrew W. Lo, A. Craig MacKinlay, 2011-11-14 For over half a century financial experts have regarded the movements of markets as a random walk unpredictable meanderings akin to a drunkard's unsteady gait and this hypothesis has become a cornerstone of modern financial economics and many investment strategies. Here Andrew W. Lo and A. Craig MacKinlay put the Random Walk Hypothesis to the test. In this volume which elegantly integrates their most important articles Lo and MacKinlay find that markets are not completely random after all and that predictable components do exist in recent stock and bond returns. Their book provides a state of the art account of the techniques for detecting predictabilities and evaluating their statistical and economic significance and offers a tantalizing glimpse into the financial technologies of the future. The articles track the exciting course of Lo and MacKinlay's research on the predictability of stock prices from their early work on rejecting random walks in short horizon returns to their analysis of long term memory in stock market prices. A particular highlight is their now famous inquiry into the pitfalls of data snooping biases that have arisen from the widespread use of the same historical databases for discovering anomalies and developing seemingly profitable investment strategies. This book invites scholars to reconsider the Random Walk Hypothesis and by carefully documenting the presence of predictable components in the stock market also directs investment professionals toward superior long term investment returns through disciplined active investment management.
