

Forces, Rivers, and Wind

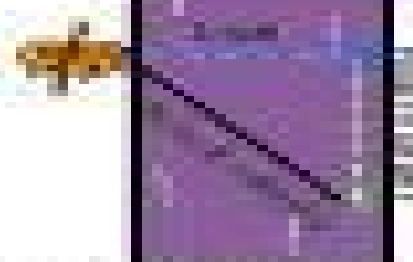

Officer Red is using Forces and Motion to help solve the objective crime described previously. Remember, the crime is the murder of Officer Brown by Officer Red.

Example 1:

The path of upstream motion is affected by the faster moving flow. How fast are the upstream boats moving?

Example 2:

This velocity is the sum of the river and the boat. How fast are the downstream boats moving?

Example 3:

How long will it take for the boat to cross the river? What is the boat's actual direction?

$$v_x + v_y = v$$

There, it said! It says vectors for the boat, adding up a moving object and a the river showing the actual location/velocity/direction.

ACROSS

This direction for each vector is called a direction, angle, location, from the position, time.

It's this magnitude of each vector's effect associated with its speed, or force.

1. An example of velocity is speed. The boat is moving upstream at a rate of 10 mph. But the river is moving downstream at a rate of 5 mph.

Find the actual upstream motion, and the angle the path makes with the horizontal.

river	boat	river	boat
10	10 mph	5	5 mph
10	5 mph	0	0
10 + 10	20 mph	10	10 mph

The boat would actually be going down, at an angle of 26.57° from the horizontal.
