

What Is A Thermistor?

- Thermistors are resistors with resistance that changes based on temperature, used widely in temperature sensing, control, and compensation circuits
- There are two main types: Negative Temperature Coefficient (NTC) thermistors, which decrease in resistance as temperature increases, and Positive Temperature Coefficient (PTC) thermistors, which increase in resistance as temperature rises
- They are typically made from ceramic materials such as metal oxides, and their application includes temperature sensing, control, over-temperature protection, and inrush current limiting
- When selecting a thermistor, it's crucial to consider factors such as temperature range, sensitivity, stability, and physical size and shape
