2. Outline

2-1. Outline of System

- The common rail system was developed primarily to cope with exhaust gas regulations for diesel engines, and aimed for 1. further improved fuel economy, 2. noise reduction, and 3. high power output.

A. System Characteristic

- The common rail system uses a type of accumulation chamber called a rail to store pressurized fuel, and injectors that control electronically controlled solenoid valves to spray the pressurized fuel into the cylinder.
- Because the engine ECU controls the injection system (including the injection pressure, injection rate, and injection timing), the injection system is unaffected by the engine speed or load.
- This ensures a stable injection pressure at all times, particularly in the low engine speed range, and optimally decides as the amount of black smoke initially emitted by a diesel engine during start-up and acceleration.
- As a result, exhaust gas emissions are cleaner and reduced, and higher power output is achieved.

B. Injection Pressure Control

- Enables high-pressure injection even at low engine speeds.
- Optimizes controls to minimize particulate matter and NOx emissions.

C. Injection Timing Control

- Enables finely tuned optimized control in accordance with driving conditions.

D. Injection Rate Control

- Pre-injection control sprays a small amount of fuel before the main injection.

E. EGR (Exhaust Gas Recirculation) Control

- By recirculating the exhaust gas into the intake side of the engine, the combustion temperature is reduced and NOx is decreased.
