

Chapter 14: Gene Expression: From Gene to Protein

- The DNA inherited by an organism leads to specific traits by dictating the synthesis of proteins and of RNA molecules involved in protein synthesis.
 - Proteins are the link between genotype and phenotype
- **Gene expression: process by which DNA directs synthesis of proteins or in some cases, just RNAs**
 - include two stages: transcription and translation

14.1: Genes specify via transcription and translation

- 1902-physician Archibald Garrod first suggested that **genes dictate phenotypes through enzymes**, proteins that catalyze chemical reactions in the cell
 - **Postulated that symptoms of a disease reflect inability to make a particular enzyme**
- Cells synthesize and degrade organic molecules via metabolic pathways that is catalyzed by enzyme

Nutritional Mutants: Scientific Inquiry

- Beadle and Edward Tatum began studying the haploid bread mold *Neurospora crassa*.
 - They studied mutations that altered the ability of the fungus to grow on minimal medium. In order to observe a change in a mutant's phenotype, they needed to disable one allele of a protein-coding gene.
- Beadle and Tatum generated different "nutritional mutants" of *Neurospora* cells, each of which was unable to synthesize a particular essential nutrient.
- One gene-one polypeptide hypothesis: each gene is responsible for the synthesis of a single polypeptide (originally it was enzyme and then protein but it was modified)
- Genes provide instructions for making specific proteins, but RNA is the bridge between DNA and protein synthesis
- Getting from DNA to protein requires two stages:
 - Transcription and translation
- **Transcription:** synthesis of RNA using information in the DNA
 - Transcription produces mRNA
- **Translation:** synthesis of a polypeptide (protein) using information in the mRNA
 - Occurs in ribosome- they facilitate the linking of amino acids into polypeptide chains
- **Bacteria vs eukaryotes:**
 - Flow of genetic information within the cells is different with bacteria because they do not have nuclei. Therefore, nuclear membranes do not separate bacterial

Appa, Leonidas Pitsoulis, H. Paul Williams, 2006-08-18 The primary reason for producing this book is to demonstrate and communicate the pervasive nature of Discrete Optimisation It has applications across a very wide range of activities Many of the applications are only known to specialists Our aim is to rectify this It has long been recognized that modelling is as important if not more important a mathematical activity as designing algorithms for solving these discrete optimisation problems Nevertheless solving the resultant models is also often far from straightforward Although in recent years it has become viable to solve many large scale discrete optimisation problems some problems remain a challenge even as advances in mathematical methods hardware and software technology are constantly pushing the frontiers forward The subject brings together diverse areas of academic activity as well as diverse areas of applications To date the driving force has been Operational Research and Integer Programming as the major extension of the well developed subject of Linear Programming However the subject also brings results in Computer Science Graph Theory Logic and Combinatorics all of which are reflected in this book We have divided the chapters in this book into two parts one dealing with general methods in

the modelling of discrete optimisation problems and one with specific applications The first chapter of this volume written by Paul Williams can be regarded as a basic introduction of how to model discrete optimisation problems as Mixed Integer Programmes and outlines the main methods of solving them **Readers' Guide to Periodical Literature** ,1909
