Analysis and Presentation of Experimental Results Costas Christodoulides, George Christodoulides, 2017-06-14 This book is intended as a guide to the analysis and presentation of experimental results. It develops various techniques for the numerical processing of experimental data using basic statistical methods and the theory of errors. After presenting basic theoretical concepts, the book describes the methods by which the results can be presented both numerically and graphically. The book is divided into three parts of roughly equal length addressing the theory, the analysis of data, and the presentation of results. Examples are given and problems are solved using the Excel, Origin, Python, and R software packages. In addition, programs in all four languages are made available to readers, allowing them to use them in analyzing and presenting the results of their own experiments. Subjects are treated at a level appropriate for undergraduate students in the natural sciences, but this book should also appeal to anyone whose work involves dealing with experimental results.

Soft X-Rays and Extreme Ultraviolet Radiation David Attwood, 2007-02-22 This detailed comprehensive book describes the fundamental properties of soft X-rays and extreme ultraviolet (EUV) radiation and discusses their applications in a wide variety of fields, including EUV lithography for semiconductor chip manufacture and soft X-ray biomicroscopy. The author begins by presenting the relevant basic principles, such as radiation and scattering, wave propagation, diffraction, and coherence. He then goes on to examine a broad range of phenomena and applications. The topics covered include spectromicroscopy, EUV astronomy, synchrotron radiation, and soft X-ray lasers. The author also provides a wealth of useful reference material, such as electron binding energies, characteristic emission lines, and photoabsorption cross sections. The book will be of great interest to graduate students and researchers in engineering, physics, chemistry, and the life sciences. It will also appeal to practising engineers involved in semiconductor fabrication and materials science.

Fundamentals of Fluorescence Microscopy Partha Pratim Mondal, Alberto Diaspro, 2013-12-12 This book starts at an introductory level and leads the reader to the most advanced topics in fluorescence imaging and super-resolution techniques that have enabled new developments, such as nanobioimaging, multiphoton microscopy, nanometrology, and nanosensors. The interdisciplinary subject of fluorescence microscopy and imaging requires complete knowledge of imaging optics and molecular physics. So this book approaches the subject by introducing optical imaging concepts before going in more depth about advanced imaging systems and their applications. Additionally, molecular orbital theory is the important basis to present molecular physics and gain a complete understanding of light-matter interaction at the geometrical focus. The two disciplines have some overlap, since light controls the molecular states of molecules, and conversely, molecular states control the emitted light. These two mechanisms together determine essential imaging factors, such as molecular cross-section, Stokes shift, emission and absorption spectra, quantum yield, signal-to-noise ratio, Förster resonance energy transfer (FRET), fluorescence recovery after photobleaching (FRAP), and fluorescence lifetime. These factors form the basis of many fluorescence-based devices. The book is organized into two parts. The first part deals with the basics of imaging optics and its applications. The advanced part takes care of several imaging

techniques and related instrumentation that are developed in the last decade pointing towards far field diffraction unlimited imaging

Light Propagation in Linear Optical Media Glen D. Gillen, Katharina Gillen, Shekhar Guha, 2017-12-19 *Light Propagation in Linear Optical Media* describes light propagation in linear media by expanding on diffraction theories beyond what is available in classic optics books In one volume this book combines the treatment of light propagation through various media interfaces and apertures using scalar and vector diffraction theories After covering the fundamentals of light and physical optics the authors discuss light traveling within an anisotropic crystal and present mathematical models for light propagation across planar boundaries between different media They describe the propagation of Gaussian beams and discuss various diffraction models for the propagation of light They also explore methods for spatially confining trapping cold atoms within localized light intensity patterns This book can be used as a technical reference by professional scientists and engineers interested in light propagation and as a supplemental text for upper level undergraduate or graduate courses in optics

Fast Algorithms for the Digital Computation

of *Linear Canonical Transforms* Aykut Koc, 2011 Although it is straightforward to determine the relationship between the in focus image and the object of a simple optical system such as a lens it is far more challenging to compute the input output relationships of general first order and astigmatic optical systems Such optical systems are known as quadratic phase systems QPS and they include the Fresnel propagation in free space propagation in graded index media passage through thin lenses and arbitrary concatenations of any number of these including anamorphic astigmatic nonorthogonal elements Such computation is accomplished by representing the physical system with a general mathematical framework of integrations against kernels and then distilling the entire system into one input output relationship that can be represented by a linear integral transform The underlying mathematical integral transforms can be applied to a wider field of signal processing where they are known as the linear canonical transform LCT of a signal Conventional numerical integration methods have a computational complexity of $O(N^2)$ where N is the space bandwidth product of the sampling scheme e g the number of pixels in the field for an optical system The algorithms described here yield a complexity of only $O(N \log N)$ The key is the use of different decompositions or factorizations of a given input output relationship into simpler ones Instead of following the general physical subparts in cascaded systems and computing input output relations separately these algorithms use the simplest possible decompositions to represent the entire system in terms of least possible number of steps The algorithms are Fast Fourier Transform FFT based methods and the only essential deviation from exactness arises from approximating a continuous Fourier transform FT with the discrete Fourier transform DFT Thus the algorithms work with a performance similar to that of the fast Fourier transform algorithm in computing the Fourier transform both in terms of speed and accuracy Unlike conventional techniques these algorithms also track and control the space bandwidth products in order to achieve information that is theoretically sufficient but not wastefully redundant
