

1. Introduction

The purpose of this study is to investigate the effects of various factors on the performance of a system. The study is divided into two main parts: a theoretical analysis and an experimental investigation.

The theoretical analysis will focus on the development of a mathematical model that describes the system's behavior. This model will be used to predict the system's performance under different conditions.

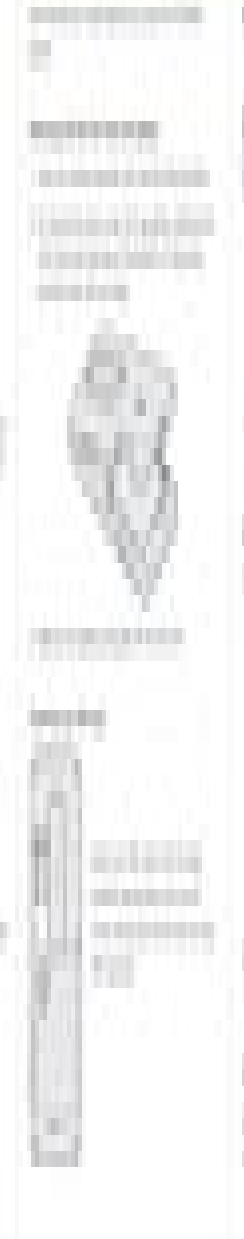

The experimental investigation will involve the construction of a physical model of the system and the measurement of its performance under various conditions. The results of the experiment will be compared with the predictions of the mathematical model.

The results of the study will be presented in a series of plots and tables. These results will be used to draw conclusions about the system's performance and to identify the factors that have the most significant impact on its behavior.
