Ge Series One Programmer Manual:

Mainframe Computer Systems Stephen H. Kaisler, 2020-10-22 This volume describes General Electric Corporation's venture into developing second and third generation mainframe computer systems. The General Electric Corporation (GE), which began its life as the Edison Electric Co., was long involved in electrical appliances and industrial machines. It was also a founder of the Radio Corporation of America, which eventually became one of its competitors and developed many electrical systems in order to control different types of industrial machines. Its breakthrough into computing came with its winning bid to provide the computing systems for the Electronic Recording Method of Accounting system developed for the Bank of America by the Stanford Research Institute. The success of this project led GE to develop the GE 200 series, which was the foundation for commercial timesharing. The GE 235 was selected by Dartmouth for its Dartmouth Time Sharing System (DTSS), an innovative academic time sharing system. BASIC was developed on the GE 235 computer system under DTSS. GE enhanced it to develop its Mark II Time Sharing System, apparently the first commercial time sharing service in the world. GE developed the GE 300/400 systems for industrial process control. The GE 600 series replaced the GE 200 series and demonstrated innovation in time sharing systems. The GE 645 was selected to host Multics, which was developed by MIT. However, GE felt that it could not compete in computing against IBM Univac and other mainframes competitors, so it folded its tent and sold its Computer Division to Honeywell Inc. Nevertheless, GE will be remembered for many innovations which continue to be used in modern computing systems.

Silicon Valley gets all the credit for digital creativity, but this account of the pre-PC world when computing meant more than using mature consumer technology challenges that triumphalism. The invention of the personal computer liberated users from corporate mainframes and brought computing into homes. But throughout the 1960s and 1970s, a diverse group of teachers and students working together on academic computing systems conducted many of the activities we now recognize as personal and social computing. Their networks were centered in New Hampshire, Minnesota, and Illinois, but they connected far-flung users. Joy Rankin draws on detailed records to explore how users exchanged messages, programmed music, and poems, fostered communities, and developed computer games like The Oregon Trail. These unsung pioneers helped shape our

digital world just as much as the inventors garage hobbyists and eccentric billionaires of Palo Alto By imagining computing as an interactive commons the early denizens of the digital realm seeded today s debate about whether the internet should be a public utility and laid the groundwork for the concept of net neutrality Rankin offers a radical precedent for a more democratic digital culture and new models for the next generation of activists educators coders and makers Publications Catalog United States.
