

How an Air Conditioner Works:

Similar to how a refrigerator works, air conditioners transfer heat from a home's interior to the warm outside environment.

(A) Evaporator

Cooling coils remove heat and humidity from the air using refrigerant.

(B) Blower

A blower (or fan) circulates air over the evaporator, dispersing the chilled air.

(C) Condenser

Hot coils release the collected heat into the outside air.

(D) Compressor

A pump that moves refrigerant between the evaporator and the condenser to chill the indoor air.

(E) Fan

A fan blows air over the condenser to dissipate the heat outside.

(F) Filter

Located in the air conditioning unit to remove particles from the air.

(G) Thermostat

A control system to regulate the amount of cool air that is distributed.
