### Genetics Joins Evolutionary Theory

#### Genetics Joins Evolutionary Theory

Gregor Mendel's original ideas on how hereditary information is passed:

- 1. Hereditary information that comes from parents are controlled by genes and that these genes have a hereditary basis in cells. The combination of different alleles in an individual determines the individual's phenotype.
- 2. Genes are passed from one generation to the next in populations. Alleles in a population form a gene pool.
- 3. **Allele frequency**: is the number of copies of an allele in a gene pool. Allele frequencies can change over time.

**Examples of Mendel's "hereditary" factors** were controlled genetic transmission, genetic inheritance, and the production of offspring.

- 1. Alleles are passed from one generation to the next.
- 2. Alleles are passed from one generation to the next. Alleles are passed from one generation to the next. Alleles are passed from one generation to the next.
- 3. Alleles are passed from one generation to the next. Alleles are passed from one generation to the next. Alleles are passed from one generation to the next.

**Single Gene and Polygenic Traits** Hereditary information is passed from one generation to the next. Alleles are passed from one generation to the next.

- 1. In single gene traits, the alleles are passed from one generation to the next. Alleles are passed from one generation to the next.
- 2. In polygenic traits, the alleles are passed from one generation to the next. Alleles are passed from one generation to the next.
