

Genetics Practice Problems: Pedigree Tables

Remember the following when working pedigree tables:

- 1) Circles are females and squares are males.
- 2) A shaded circle or square indicates that a person has the trait.

The pedigree seen below is for colorblindness. Shaded individuals are colorblind. First, determine the probable genotype of persons 1 – 15; then, answer the questions below the table.

How did you determine the genotype of the mother at 3?

Number 8 was colorblind just like his father. Where did the son at 8 get his allele for colorblindness?

Neither numbers 1 nor 2 were colorblind. How did they have a colorblind son (6)?

What must be the genotypes of the parents of a colorblind daughter? Explain.

If number 13 marries a normal man, what is the probability that their sons will be colorblind?

to enhance a domain specific generic capability pedigree analysis of Hong Kong secondary five students so as to help them
develop their capability to solve pedigree problems Pedigree analysis is a study of inheritance in genetics which includes the
deduction of dominant and recessive characters The literature and local examination reports suggested that solving pedigree
problems is difficult for students as the process of deduction demands conceptual understanding and use of scientific
language Three biology teachers participated in this learning study using variation theory Teachers shifted the focus of
lesson observation from teaching performance to student learning to how students deduced the dominant character from
pedigree problems which was the object of learning To explore the effectiveness of such teaching and learning to solve
pedigree problems through different patterns of variation two cycles of learning study were conducted in two senior biology
classes Results showed that students were more able to deduce the dominant character with relevant genetic principles by
experiencing the variations Both conceptual understanding and scientific language are critical aspects of solving pedigree
problems This study also suggests that explanatory scientific writing needs to be broken down into different components and
then differentiated patterns of variation designed to let students discern those components and their relationships in that
way their writing can be scaffolded in a stepwise manner rather than giving them the whole writing framework at once
However the identification of critical features and patterns of variation and their relevance to the object of learning should be
considered carefully and explored further DOI 10 5353 th_b5387974 Subjects Study and teaching Secondary Genetics China
