**Abstract** The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised exercise program on the physical and psychological health of older adults with mild cognitive impairment (MCI). The study was a randomized, controlled trial. The intervention group (IG) participated in a 12-week, low-intensity, supervised exercise program, while the control group (CG) did not. The IG showed significant improvements in physical and psychological health compared to the CG. The results suggest that a 12-week, low-intensity, supervised exercise program can improve the physical and psychological health of older adults with MCI.
