Wild Immunology—The Answers Are Out There Gregory M. Woods, Andrew S. Flies, 2019-03-20 Go into partnership with nature she does more than half the work and asks none of the fee Martin H Fisher Nature has undertaken an immense amount of work throughout evolution The evolutionary process has provided a power of information that can address key questions such as Which immune molecules and pathways are conserved across species Which molecules and pathways are exploited by pathogens to cause disease What methods can be broadly used or readily adapted for wild immunology How does co infection and exposure to a dynamic environment affect immunity Section 1 addresses these questions through an evolutionary approach Laboratory mice have been instrumental in dissecting the nuances of the immune system The first paper investigates the immunology of wild mice and reviews how evolution and ecology sculpt differences in the immune responses of wild mice and laboratory mice A better understanding of wild immunology is required and sets the scene for the subsequent papers Although nature doesn't ask for a fee it is appropriate that nature is repaid in one form or another The translational theme of the second section incorporates papers

that translate wild immunology back to nature But any non human non laboratory mouse research environment is hindered by a lack of research tools hence the underlying theme throughout the second section Physiological resource allocation is carefully balanced according to the most important needs of the body Tissue homeostasis can involve trade offs between energy requirements of the host and compensatory mechanisms to respond to infection The third section comprises a collection of papers that employ novel strategies to understand how the immune system is compensated under challenging physiological situations Technology has provided substantial advances in understanding the immune system at cellular and molecular levels The specificity of these tools e g monoclonal antibodies often limits the study to a specific species or strain A consequence of similar genetic sequences or cross reactivity is that the technology can be adapted to wild species Section 4 provides two examples of probing wild immunology by adapting technology developed for laboratory species

Exploring the Biopsychosocial Model in Irritable Bowel Syndrome Anna-Karin Norlin, 2020-10-09 Background Irritable bowel syndrome IBS is a common chronic relapsing and sometimes disabling symptombased disorder of gut brain interactions It has got a female predominance and occurs in all ages with a slight decrease among elderly The IBS symptoms can affect everyday work and social life in addition to an increased use of health care resources Most IBS patients are diagnosed and helped in primary health care PHC For many patients available treatment is insufficient It is known that both extraintestinal symptoms such as fatigue as well as comorbidities such as mood disorders chronic pain syndromes and insomnia contribute to the illness burden often to a larger extent than the gastrointestinal symptoms as such Even though the pathophysiology of IBS is not completely known it is now conceptualized as a disorder of altered brain gut interactions where a biopsychosocial model helps in understanding the symptoms Exposure to stress is thought to play an important role overall in the pathology of IBS as well as immune activation at least in a subgroup of patients This thesis aimed to gain deeper understanding of the biopsychosocial mechanisms of IBS and its associations with stress comorbidities and fatigue Methods Study I and II are based on the Twin cities IBS study population which included IBS patients and a control group of other patients without gastrointestinal complaints from ten PHC centres in the county of sterg tland Alongside demographics psychosocial questionnaires and a GI symptom diary it included analyses of hair cortisol concentrations HCC evaluated in study I and data on self rated health as well as diagnoses of comorbidities and number of health care contacts from a regional registry evaluated for study II Study III of this thesis is based on the Brain Gut study with a population of secondary care IBS patients and healthy controls HC It included self rated measures of fatigue impact on the daily life and early adverse life events as well as measures of circulating TNF and analyses of resting state functional magnetic resonance imaging of brain areas within a mesocorticolimbic circuitry of known relevance for fatigue Results Study I Perceived stress was higher in the IBS group while a considerable portion of IBS patients had low levels of HCC No association between perceived stress and HCC was seen in either group Study II IBS patients had lower self rated health and more PHC utilization than the non IBS patients

Good self rated health was independently associated with younger age higher sense of coherence and less gastrointestinal pain in both groups In IBS PHC utilization was associated with comorbidities in general and sleep disorders in particular Study III Fatigue impact on daily life and TNF were higher in IBS patients than in HC In IBS further an association was seen between fatigue impact on the one hand and TNF emotional abuse in childhood as well as altered mesocorticolimbic connectivity on the other Conclusion In conclusion this thesis firstly emphasizes that IBS patients in many ways including health outcomes consists a vulnerable group of PHC patients We add evidence for a possible suppression of the stress response system in a substantial portion of IBS patients Further comorbid sleep disorders seem to be particularly associated with excess PHC utilization in IBS and could possibly be a target for treatment interventions Moreover alongside treating gastrointestinal pain efforts to improve the individuals sense of coherence could be one way to achieve better self rated health in both IBS and non IBS patients Finally we suggest that fatigue in IBS is associated with immune activation central alterations and to some extent also previous childhood trauma IBS Irritable Bowel Syndrome är en vanlig kronisk tarmsjukdom med terkommande symtom av buksmärta tillsammans med nedsatt avförselsvanor Den drabbar cirka 10% av befolkningen och är vanligast hos kvinnor samt något mindre vanlig hos äldre För många innebär IBS ett stort lidande försvårat livskvalitet och ökad sjukvårdskonsumtion De flesta IBS patienter tas om hand i primär vården Nuvarande tillgänglig behandling är ofta otillräcklig En del IBS patienter har också andra symtom såsom muskelsmärta och uttalad trötthet som inte går över vid vila så kallad fatigue Det är också vanligt förekommande med andra sjukdomstillstånd såsom depression och andra smärtsyndrom Det är visat att den typen av symtom och samsjuklighet många gånger för IBS patienten när de faktiska magtarmsymptomen Numera tror man att symtomen vid IBS beror på störningar i det närliggande samspelet mellan tarm och hjärna men de bakomliggande mekanismerna är inte helt klarlagda För att förstå IBS patientens symtom är en så kallad biopsykosocialt förklaringsmodell till stor hjälp då symtomen inte bara beror av biologiska mekanismer utan individens sociala miljö samt psykologiska reaktioner spelar också stor roll Stress är centralt för utveckling av som symtom vid IBS och verkar förstås också för den biopsykosociala förklaringsmodellen generellt Tidigare forskning visar också att immunsystemet är påverkat hos minst en andel av IBS patienterna Syftet med den här avhandlingen var att undersöka djupare förståelse av biopsykosociala mekanismer vid IBS med fokus på stress samsjuklighet och fatigue Delstudie I och II jämförde IBS patienter och en kontrollgrupp med andra primär vårdspatienter utan magtarmsymtom på 10 vårdcentraler i stergötland Delstudie III undersökte IBS patienter på magtarmkliniken i Linköping jämförda med friska kontroller I delstudie I undersökte vi kortisol i högre nivåer som ett mått på hur stresshormonnivåerna varit över tid Trots att IBS patienterna som grupp beskrev en större självupplevd stress än icke IBS patienterna hade en andel förhållandevis låga nivåer av kortisol i högre nivåer I delstudie II undersökte vi hur samsjuklighet i form av totalt antal registrerade diagnoser samt vissa specifika diagnoser och psykologiska aspekter samt magtarmsymtom påverkade självskattad hälsa och primär vårdskonsumtion hos IBS och icke IBS patienterna I båda grupperna

var i sig själva starkt relaterade till grad av buksmärta oberoende associerat med betydande självskattad hälsa. Hos IBS-patienterna fann vi närmast en femfaldigt ökad risk att ha många kontakter med primärvården vid samtidigt diagnostiserad smärtsjukdom. Den kopplingen sågs inte hos patienterna utan IBS. Däremot var det totala antalet diagnoser också en faktor av betydelse för vardagskonsumtionen i båda grupperna. I delstudie III belyste vi fatigue och eventuella kopplingar till nivåer av en proinflammatorisk signalmolekyl TNF samt till självrapporterade missfallstillstånd under uppvisningen hos IBS-patienter och friska kontroller. Med funktionell magnetkameraundersökning av hjärnan undersökte vi också kopplingen mellan aktivitetsmönster i områden som relaterade till emotionella, kognitiva och motivationsrelaterade aspekter av fatigue hos IBS-patienter och friska kontroller. Vi fann att IBS-patienterna upplevde fyrfaldigt mer påverkan av fatigue på sina dagliga liv än kontroller. Den kade trötthetsupplevelsen var också relaterad till högre nivåer av TNF i blodet hos IBS-patienterna liksom i viss mån till missfallstillstånd under uppvisningen. Slutligen såg vi att högre grad av upplevd fatigue hos IBS-patienterna ledde till minskad samtida aktivitet, konnektivitet i de undersökta hjärnområdena som representerade de motivationsrelaterade och kognitiva aspekterna av trötthetsupplevelsen. Någon liknande koppling mellan TNF och förändringar i hjärnaktiviteten sågs ej. Sammanfattningsvis pekar våra resultat gällande samsjuklighet självskattad hälsa, psykosociala faktorer samt fatigue på att IBS-patienterna är en särskild patientgrupp som bör uppmärksammas. Våra resultat från delstudie I pekar vidare mot att stressaxeln kan vara uttrötad hos vissa IBS-patienter. Enligt resultaten i delstudie II är känslan av sammanhang jämförbara buksmärta faktorer som bör tas i beaktande för att om möjligt uppnå betydande självskattad hälsa både hos IBS och andra primärvårdspatienter. Vidare synes IBS-patienternas förhållandevis stora vardagskonsumtion vara särskilt avhängig av samtidig smärtsjukdom vilket också det torde vara av betydelse i klinisk praxis och av intresse för framtida forskning. Delstudie III visar ett samband mellan fatigue som bisymtom vid IBS och själva barndomsstrauman som möjlig immunaktivering. Vi fann även att IBS-patienter som upplevde stor påverkan av fatigue på sina dagliga liv också hade en minskad konnektivitet mellan hjärnstrukturer av betydelse för kognition och motivation.
